RE: Groundhog: Year 2 Monitoring Report (NCDMS ID 100049)

Listed below are comments provided by DMS on January 24, 2023 regarding the Groundhog Mitigation Site: Year 2 Report and RES' responses highlighted in blue.

- Section 1.4 Project Components: "Due to landowner and utility requirements, there are
 four easement breaks within the project." The CCPV map identifies five (5) project
 crossings. Please review and revise the report and report text as necessary.
 There are five easement breaks on site, four crossings and one break due to a utility
 easement. This has been updated in the report.
- Section 1.7 Monitoring Performance (MY2) Vegetation: Please provide a separate MY2 (2022) supplemental planting list and supplemental planting map in the report appendices. The supplemental planting list should also include the wetland indicator status for the species.
 - A supplemental planting figure and summary table have been added to Appendix C.
- Section 1.7 Monitoring Performance (MY1)_Stream Hydrology: In the report text, please review and provide additional discussion regarding the unusual number of bankfull events reported in a normal rainfall year. Are the number of bankfull events reported on the site considered a project concern?
 The large number of out of bank events are not a concern for us at this time. The
 - The large number of out of bank events are not a concern for us at this time. The channels were designed for water to access the floodplain. The reaches containing the gages are stable with established vegetation. The report has been updated to reflect this.
- Table 4 Project Background Information: Please include the reaches' thermal regime (warm) in the table.
 Done.
- CCPV Map: Please show the stage recorder reported on GF2-B on the CCPV Map.
 Please update the "Deteriorating Structure" map call out to "Deteriorating Stream Structure" to avoid confusion with a dilapidated building potentially being located within the conservation easement.

The stage recorder is present on the CCPV however is obscured by the XS 18 label and can be hard to see. The gage has been shifted slightly on the figure for clarification. The stream structure callout has been updated.

- Report Text/ Table 6/ CCPV Map: The report text indicates that approximately 0.21 acres of Chinese Privet was "flush cut" in MY1 and will require further invasive treatment in 2023. Chinese privet was also noted along GF1-A, GF1-B, GF2-B, and GF4-A during MY2 and is proposed for treated in 2023. Table 6 shows 0% invasive areas of concern and the CCPV maps provided in the draft report are not consistent with the report text in Section 1.7. Please review the report text, tables and CCPV Map and update them so the invasives reported on the project site are consistent through the final MY2 document. The report body and Table 6 has been updated with the correct acreage of Chinese privet of 0.26 acres not 0.21 acres as originally stated. The concentrations of Chinese privet have been noted on the CCPV, however there are scattered stems along GF1-A, GF1-B, GF2-B, and GF4-A.
- Appendix B: Please provide an additional single page georeferenced "Asset Map" in the appendix that clearly identifies the project reaches and stream approaches as specified in Table 1.
 - An Asset figure has now been included in Appendix B.
- Appendix B Groundhog Hollow Crossing Photos: Please also include upstream and downstream photos of the crossing on GF4A/GF4B in the final MY2 report.
 A downstream photo of the culvert crossing on GF4A/GF4B has bow been included in the report. A large hornets nest was located where the monitoring team would take an upstream photo, due to team mates allergies a photo was not taken. Photographs will be taken of the culvert crossing in MY3.

Digital Support File Comments:

- Please note that the reach designations violate DMS attribute rules. Each reach must have a unique segment ID for future submissions.
 This has been noted, thank you.
- The Visual Assessment tables must reflect the problem areas indicated on the CCPV unless established thresholds are not met. The invasives noted on the CCPV exceed the threshold but do not appear in the visual assessment table.

Table 6 has been updated to include the invasive vegetation polygons and is included in the digital support files.

1.0 Project Summary

1.1 Project Location and Description

The Groundhog Hollow Project ("Project") is located within a rural watershed in Alexander County, North Carolina approximately three and a half miles northwest of Taylorsville. Water quality stressors affecting the Project included livestock production, agricultural production, and lack of riparian buffer. The Project presents stream restoration and enhancement generating 4,093.95 Warm Stream Mitigation Units (SMU).

The Project's total easement area is 20.58 acres within the overall drainage area of 156 acres. Grazing livestock historically had access to all the stream reaches within the Project. The lack of riparian buffer vegetation, deep-rooted vegetation, and unstable channel characteristics contributed to the degradation of stream banks throughout the Project area.

The stream design approach for the Project was to combine the analog method of natural channel design with analytical methods to evaluate stream flows and hydraulic performance of the channel and floodplain. The analog method involved the use of a reference reach, or "template" stream, adjacent to, nearby, or previously in the same location as the design reach. The template parameters of the analog reach were replicated to create the features of the design reach. The analog approach is useful when watershed and boundary conditions are similar between the design and analog reaches. Hydraulic geometry was developed using analytical methods to identify the design discharge.

The Project has been constructed and planted and will be monitored on a regular basis throughout the seven-year post-construction monitoring period, or until performance standards are met. The Project will be transferred to the NCDEQ Stewardship Program. This party shall serve as conservation easement holder and long-term steward for the property and will conduct periodic inspection of the site to ensure that restrictions required in the conservation easement are upheld.

1.2 Project Goals and Objectives

Through the comprehensive analysis of the Project's maximum functional uplift using the Stream Functions Pyramid Framework, specific, attainable goals will be realized by the Project. These goals clearly address the degraded water quality and nutrient input from farming that were identified as major watershed stressors in the 2009 (amended 2018) Upper Catawba River Basin Restoration Priorities (RBRP). These goals and objectives reflect those stated in the Groundhog Hollow Project Final Mitigation Plan.

The Project goals are:

- Improve water transport from watershed to the channel in a non-erosive manner in a stable channel;
- Improve flood flow attenuation on site and downstream by allowing for overbank flows and connection to the floodplain;
- Improve instream habitat;
- Reduce sediment, nutrient, and fecal coliform inputs into stream system;
- Restore and enhance native floodplain vegetation; and
- Indirectly support the goals of the 2009 Upper Catawba RBRP to improve water quality and to reduce sediment and nutrient loads

The Project goals were addressed through the following project objectives:

- Designed and reconstructed stream channels that convey bankfull flows while maintaining stable dimension, profile, and planform;
- Added in-stream structures and bank stabilization measures to protect restored streams;
- Installed habitat features such as brush toes, constructed riffles, woody materials, and pools of varying depths to restored streams;
- Increased forested riparian buffers to at least 50 feet on both sides of the channel along the Project reaches with a hardwood riparian plant community;
- Installed approximately 12,000 linear feet of livestock exclusion fencing along the easement boundary to ensure livestock will no longer have stream access;
- Treated exotic invasive species; and
- Established a permanent conservation easement on the Project that will exclude future livestock from stream channels and their associated buffers and prevent future land use changes.

Functional uplift, benefits, and improvements within the Project area, as based on the Function Based Framework, are outlined in the Mitigation Plan.

1.3 Project Success Criteria

The success criteria for the Project follows the 2016 USACE Wilmington District Stream and Wetland Compensatory Mitigation Update, the Groundhog Hollow Project Final Mitigation Plan, and subsequent agency guidance. Cross section and vegetation plot monitoring takes place in Years 0, 1, 2, 3, 5, and 7. Stream hydrology and visual monitoring takes place annually. Specific success criteria components are presented below.

Stream Restoration Success Criteria

Four bankfull flow events must be documented within the seven-year monitoring period. The bankfull events must occur in separate years. Otherwise, the stream monitoring will continue until four bankfull events have been documented in separate years.

There should be little change in as-built cross sections. If changes do take place, they should be evaluated to determine if they represent a movement toward a less stable condition (for example down-cutting or erosion) or are minor changes that represent an increase in stability (for example settling, vegetative changes, deposition along the banks, or decrease in width/depth ratio). Cross sections shall be classified using the Rosgen stream classification method, and all monitored cross sections should fall within the quantitative parameters defined for channels of the design stream type. Bank height ratio shall not exceed 1.2, and the entrenchment ratio shall be above 1.4 within restored riffle cross sections. Channel stability should be demonstrated through a minimum of four bankfull events documented in the seven-year monitoring period.

Digital images are used to subjectively evaluate channel aggradation or degradation, bank erosion, success of riparian vegetation, and effectiveness of erosion control measures. Longitudinal images should not indicate the absence of developing bars within the channel or an excessive increase in channel depth. Lateral images should not indicate excessive erosion or continuing degradation of the banks over time. A series of images over time should indicate successional maturation of riparian vegetation.

Specific Project reaches will be monitored to document intermittent or seasonal surface flow. Intermittent reaches must demonstrate a minimum of 30 consecutive days of flow.

Vegetation Success Criteria

Specific and measurable success criteria for plant density within the riparian buffers on the Project follow IRT Guidance. The interim measures of vegetative success for the Project is the survival of at least 320 planted three-year old trees per acre at the end of Year 3, 260 trees per acre with an average height of seven feet at the end of Year 5, and the final vegetative success criteria is 210 trees per acre with an average height of ten feet at the end of Year 7. Volunteer trees are counted, identified to species, and included in the yearly monitoring reports, but are not counted towards the success criteria of total planted stems until present for greater than two seasons. Moreover, any single species can only account for up to 50 percent of the required number of stems within any vegetation plot. Any stems in excess of 50 percent will be shown in the monitoring table but will not be used to demonstrate success.

Le	Level Treatmen		Objective	Monitoring Metric	Performance Standard																
1	Hydrology	Convert land-use of Project reaches from pasture to riparian forest	Improve the transport of water from the watershed to the Project reaches in a nonerosive way	NA	NA																
				Stage recorders: Inspected quarterly	Four bankfull events occurring in separate years																
2	Hydraulic	Reduce bank height ratios and increase entrenchment ratios	Improve flood bank connectivity by reducing bank height	Flow gauge: Inspected quarterly	At least 30 days of continuous flow each year																
4	Hydr	by reconstructing channels to mimic reference reach conditions	ratios and increase entrenchment ratios	Cross sections: Surveyed	Entrenchment ratio shall be no less than 1.4 within restored reaches																
		conditions	in Years 1, 2, 3, 5 and 7		Bank height ratio shall not exceed 1.2																
				As-built stream profile	NA																
		Establish a riparian	Limit erosion rates	Cross sections: Surveyed in Years 1, 2, 3, 5 and 7	Entrenchment ratio shall be no less than 1.4 within restored reaches

3	Geomorphology	into project streams. Establish stable banks with livestakes, erosion control matting, and other in stream		Visual monitoring: Performed at least semiannually	Identify and document significant stream problem areas; i.e. erosion, degradation, aggradation, etc.																
		structures.	width to 50 feet	Vegetation plots: Surveyed in Years 1, 2, 3, 5 and 7	MY 1-3: 320 trees/acre MY 5: 260 trees/acre (7 ft. tall) MY 7: 210 trees/acre (10 ft. tall)																
4	Physicochemical	Exclude livestock from riparian areas with exclusion fence, conservation easement, and plant a riparian buffer	Unmeasurable Objective/Expected Benefit Establish native hardwood riparian buffer and exclude livestock.	Vegetation plots: Surveyed in Years 1, 2, 3, 5 and 7 (indirect measurement)	MY 1-3: 320 trees/acre MY 5: 260 trees/acre (7 ft. tall) MY 7: 210 trees/acre (10 ft. tall)																

1.4 Project Components

The Project area is comprised of a 20.58-acre easement involving four unnamed tributaries which drain directly into the Lower Little River which eventually drains into the Catawba River. These four Project streams are split into nine reaches based on treatment type and/or changes in flow: GF1-A, GF1-B, GF2-A, GF2-B, GF3-A, GF3-B, GF4-A, GF4-B, and GF5.

Due to landowner and utility requirements, there are five easement breaks within the project. One break is for an existing utility easement; fencing was installed across the utility easement in order to provide contiguous livestock exclusion to the stream. The other three are locations for current agricultural crossings. These easement breaks will allow landowners to continue current land-use and access throughout the property as needed.

Through stream restoration and enhancement, the Project presents 6,129 LF of stream, generating 4,093.95 Warm Stream Mitigation Units (SMU). The stream mitigation components are summarized below. Mitigation credits presented below are based upon the Approved Mitigation Plan. To account for areas of more or less than minimum 50-foot buffer widths, credits were adjusted using the USACE Wilmington District Stream Buffer Credit Calculator.

Mitigation Approach	Linear Feet	Ratio	Warm SMU
Restoration	2,851	1	2,851.00
Enhancement I	306	1.5	204.00
Enhancement II	2,338	2.5	935.20
Enhancement II	253	5	5060
Enhancement II	381	7.5	50.80
Total	6,129		4,091.60
	+2.35*		
	4,093.95		

^{*} Credit adjustment for Non-standard Buffer Width calculation using the Wilmington District Stream Buffer Credit Calculator issued by the USACE in January 2018.

1.5 Stream Design/Approach

The Project includes Priority I and II Restoration and Enhancement Levels I and II. Stream restoration incorporates the design of a single-thread meandering channel, with parameters based on data taken from reference sites, published empirical relationships, regional curves developed from existing project streams, and NC Regional Curves. Analytical design techniques were also a crucial element of the project and were used to determine the design discharge and to verify the design as a whole. For livestock exclusion, woven wire fencing with one strand of barbed wire at the top was installed.

The following treatments were performed on the Project reaches:

Reach GF1-A

An Enhancement Level II approach was performed for this reach to address areas of bed instability, bank erosion, and buffer impacts. Enhancement activities included:

- Stabilizing a 2-foot knick-point located near station 00+70 by installing two rock sills,
- Removal and regrading of an existing culvert crossing near station 03+50,
- Bank stabilization beginning near station 05+75 by installing a log vane and brush toe,
- Stabilizing a 5-foot headcut located near station 07+10 by installing a rock step-pool,
- Livestock exclusion.
- Riparian planting,
- Invasive vegetation treatment.

Reach GF1-B

An inline restoration approach was used for the upstream portion of the reach to address eroding banks, channel entrenchment, and buffer impacts. Restoration activities included:

- Raising the channel bed with a mix of log sill, log vanes, riffle grade controls, and clay plugs,
- Normalizing the existing channel alignment to reduce channel stress,
- Establishing a riffle pool sequence throughout the reach,
- Installing brush toe protection on meander bends,
- Transitioning existing vertical channel banks to a minimum 5:1 floodplain slope,
- Livestock exclusion,
- Riparian planting,
- Invasive vegetation treatment.

An offline priority I restoration approach was performed for the middle portion of the reach to address, eroding banks, channel entrenchment, and channel braiding. Restoration activities included:

- Regrading a new single thread channel in the existing floodplain,
- Installing log and rock structures to provide grade control and habitat,
- Establishing a riffle pool sequence throughout the reach,
- Installing brush toe protection on meander bends,
- Filling the existing channel,
- Replacing an existing ford crossing with a culvert crossing,
- Livestock exclusion,
- Riparian planting.

An offline priority II restoration approach was performed for the downstream potion of the reach to address, eroding banks, channel entrenchment, and channel braiding. Restoration activities included:

- Regrading a new single thread channel and floodplain,
- Installing log and rock structures to provide grade control and habitat,
- Establishing a riffle pool sequence throughout the reach,
- Installing brush toe protection on meander bends,
- Filling the existing channel,
- Livestock exclusion,
- Riparian planting.

Enhancement Level II was performed along the portion of the reach that ties into the Lower Little River and is within its non-encroachment area. Enhancement activities included:

- Livestock exclusion,
- Riparian planting,
- Invasive vegetation treatment.

Reach GF2-A

An Enhancement Level II approach was performed for this reach to address areas of bed instability, bank erosion, and buffer impacts. Enhancement activities included:

- Stabilizing a 9-foot headcut located near station 01+30 by installing log sills and a log step pool,
- Bed stabilization beginning near station 05+00 by installing a double log drop,
- Bank stabilization beginning near station 07+50 by installing a log vane and brush toe,
- Livestock exclusion,
- Riparian planting,
- Invasive vegetation treatment.

Reach GF2-B

A mix of offline and inline restoration was performed for this portion of the reach to address eroding banks, channel entrenchment, historic impoundment, and buffer impacts. Restoration activities included:

- Regrading a new single thread channel in the existing floodplain,
- Installing log and rock structures to provide grade control and habitat,
- Establishing a riffle pool sequence throughout the reach,
- Installing brush toe protection on meander bends,
- Removing the relic earthen dam and relic pond,
- Filling the existing channel,
- Replacing an existing ford crossing with a culvert crossing,
- Livestock exclusion,
- Riparian planting.

Reach GF3-A

An Enhancement Level I approach was performed for this reach to address areas of bank erosion, and buffer impacts. Enhancement activities included:

- Stabilizing the left bank near station 08+75 by installing a brush toe,
- Stabilizing the left bank near station 10+25 by installing a brush toe,
- Bank stabilization beginning near station 09+40 and 09+80 by installing a log vane,
- Floodplain grading,
- Livestock exclusion,
- Riparian planting,
- Invasive vegetation treatment.

Reach GF3-B

An offline restoration approach was performed for this portion of the reach to address eroding banks, channel entrenchment, and buffer impacts. Restoration activities included:

- Regrading a new single thread channel in the existing floodplain,
- Installing log and rock structures to provide grade control and habitat,
- Establishing a riffle pool sequence throughout the reach,
- Installing brush toe protection on meander bends,
- Filling the existing channel,
- Replacing an existing ford crossing with a culvert crossing,
- Livestock exclusion,
- Riparian planting.

Reach GF4-A

An Enhancement Level II approach was performed for this reach to address areas of bed instability, bank erosion, and buffer impacts. Enhancement activities included:

- Stabilizing head cut near station 00+50 by grading a vegetated swale,
- Stabilizing banks near station 01+50 by grading back channel banks,

- Bed stabilization beginning near station 03+30 by installing a rock step-pool,
- Removing and replacing the two existing 24" Corrugated Metal Pipes,
- Livestock exclusion,
- Riparian planting,
- Invasive vegetation treatment.

Reach GF4-B

A limited Enhancement Level II approach was performed for this reach at a reduced credit ratio. Enhancement activities included:

- Livestock exclusion,
- Riparian planting,
- Trash removal,
- Invasive vegetation treatment.
 - o To ensure bank stability, Chinese privet was flush cut and sprayed; therefore, subsoil was not disturbed. Roots will remain intact while plantings establish roots.

Reach GF5

An Enhancement Level II approach was performed for this reach to address buffer impacts and protect multiple spring heads. Enhancement activities included:

- Livestock exclusion,
- Riparian planting,
- Removal of existing concrete tank,
- Invasive vegetation treatment.

1.6 Construction and As-Built Conditions

Stream construction was completed in September 2020 and planting was completed in December 2020. The Groundhog Hollow Project was built to design plans and guidelines. However, in May 2021, approximately 200 linear feet of channel (three percent of the total stream length) and 10 structures underwent repairs. Generally, the problem areas were step pools, sills, banks, and old channel erosion that failed during extreme high flows that occurred before vegetation could be established. Banks were regraded and matting was added, sills were replaced, repaired, or added to reestablish proposed bed elevations, and check dams were installed in the old channel to discourage concentrated flow. Repair areas were livestaked in May 2021 and will be livestaked again if needed during the following dormant season. Additionally, bareroot supplemental planting was performed in the areas affected by the repairs.

Planting plan changes included the removal of black gum (*Nyssa sylvatica*) and hackberry (*Celtis occidentalis*). Hackberry was replaced with sugarberry (*Celtis laevigata*) and the quantities of the other planted species were increased to compensate for not planting black gum. These changes were based on bare root availability. Minor monitoring device location changes were made during as-built installation; however, the quantities remained as proposed in the Final Mitigation Plan.

1.7 Monitoring Performance (MY2)

The Groundhog Hollow Monitoring activities were performed in July and October 2022. All monitoring year two data is present below and in the appendices. The project fencing previously encroaching into the easement, discussed in the MY1 report, has been relocated out of the easement. There are no known infringements on the easement. The Project is on track to meeting interim success criteria.

Vegetation

Monitoring of the nine fixed vegetation plots and three random vegetation plots was completed on October 25th, 2022. Vegetation data is in **Appendix C**, associated photos are in **Appendix B**, and plot locations are in **Appendix B**. MY2 monitoring data indicates that all plots are exceeding the interim success criteria of 320 planted stems per acre. Planted stem densities ranged from 364 to 688 planted stems per acre with a mean of 513 planted stems per acre across all fixed plots. Stem densities ranged from 526 to 647 planted stems per acre with a mean of 701 planted stems per acre across random plots. Total average stem density across all plots is 526 stems per acre and the average planted stem height in the vegetation plots was 3.1 feet. A total of eight species were documented within the plots. Volunteer species were not noted at monitoring year two but are expected to establish in upcoming years.

Visual assessment of vegetation outside of the monitoring plots indicates that the herbaceous vegetation is becoming well established throughout the project. During MY1 the eastern bank of GF3-A and part of GF4-B was determined to have low stem counts. This area was supplementally planted in March 2022 with 92 3-gallon container trees consisting of white oak (Quercus alba), American sycamore (Platanus occidentalis), northern red oak (Quercus rubra), willow oak (Quercus phellos), and tulip poplar (Liriodendron tulipifera). Chinese privet (Ligustrum sinensis) along GF4-B, approximately 0.26 acres, was flush cut but not excavated to promote bank stability in December, 2021 of MY1. This area will be continue to be monitored for vegetative succession and will be treated again in 2023 to reduce regrowth. Scattered Chinese privet was also noted along GF1-A, GF1-B, GF2-B, and GF4-A during MY2 and is being treated in 2023.

Stream Geomorphology

A total of 22 cross sections were installed on January 27, 2021 and geomorphology data collection for MY2 was conducted on July 5th, 2022. Summary tables and cross section plots are in **Appendix D**. Overall the cross sections and profile relatively match the proposed design. Slight degradation was observed on pool cross section six and pool cross section 13 during MY1 but has remained stable during MY2. Monitoring data shows minor changes in both cross sections and riffle cross sections above and below cross sections six and 13. The MY2 conditions show that channel conditions are stable and functioning as intended. All reaches were designed as gravel bed channels and remain classified as gravel bed channels post-construction.

Visual assessment of the stream channel was performed to document signs of instability, such as eroding banks, structural instability, or excessive sedimentation. A structure on GF4-A is deteriorating where the stream is beginning to add stress to the banks around the log sills. This potential problem structure is still holding grade and shouldn't affect most aquatic passage due to its headwater proximity but will be monitored and addressed if it continues to worsen. Problem areas are cataloged in **Appendix B**. A structure on GF2-a noted in the MY1 monitoring report appears to have stabilized but will continue to be monitored. The channel over all is transporting sediment as designed and will continue to be monitored for aggradation and degradation.

Stream Hydrology

Three stage recorders and one flow gauge were installed on February 4, 2021: one stage recorder on GF1-B, one stage recorder on GF2-B, one stage recorder on GF3-B, and one flow gauge on GF4-A. The stage recorders are in place to document bankfull events and the flow gauge to document at least intermittent flow. The stage recorder on GF1-B had 11 bankfull events with the highest reading being 0.78 feet above the top of bank. The stage recorded on GF2-B recorded 16 bankfull events with the highest reading being 0.67 feet above top of bank. The stage recorded on GF3-B recorded 15 bankfull events with the highest

reading being 0.68 feet above top of bank. Despite the large number of out of bank events, the channels were designed for water to access the floodplain. The reaches the gages are installed in are stable with established vegetation and at this time is not a concern on the project. The flow gauge on GF4-A recorded one flow event lasting 297 consecutive days. Gauge locations can be found on **Figure 2** and photos are in **Appendix B**.

2.0 Methods

Stream cross section monitoring was conducted using a Topcon GTS-312 Total Station. Three-dimensional coordinates associated with cross-section data were collected in the field (NAD83 State Plane feet FIPS 3200). Morphological data were collected at 22 cross-sections. Survey data were imported into CAD, ArcGIS®, and Microsoft Excel® for data processing and analysis. The stage recorders include an automatic pressure transducer placed in PVC casing in a pool. The elevation of the bed and top of bank at each stage recorder are used to detect bankfull events. The flow gauge was also installed in a pool and records flow conditions at an hourly interval. Water level data from the flow gauge is corrected using the height of the downstream riffle to detect stream flow events.

Vegetation success is being monitored at nine fixed monitoring plots and three random monitoring plot. Vegetation plot monitoring follows the CVS-EEP Level 2 Protocol for Recording Vegetation, version 4.2 (Lee et al. 2008) and includes analysis of species composition and density of planted species. Data are processed using the CVS data entry tool. In the field, the four corners of each plot were permanently marked with PVC at the origin and metal conduit at the other corners. Photos of each plot are to be taken from the origin each monitoring year. The random plots are to be collected in locations where there are no permanent vegetation plots. Random plots will most likely be collected in the form of 100 square meter belt transects with variable dimensions. Tree species and height will be recorded for each planted stem and the transects will be mapped and new locations will be monitored in subsequent years.

Planted Acreage¹

Vegetation Condition Assessment

14.42

Last Site Inspection - Oct 25, 2022

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	Very limited cover of both woody and herbaceous material.	0.1 acres	Red Simple Hatch	0	0.00	0.0%
2. Low Stem Density Areas	Woody stem densities clearly below target levels based on MY3, 4, or 5 stem count criteria.	0.1 acres	Orange Simple Hatch	0	0.00	0.0%
Total				0	0.00	0.0%
3. Areas of Poor Growth Rates or Vigor	Areas with woody stems of a size class that are obviously small given the monitoring year.	0.25 acres	Orange Simple Hatch	0	0.00	0.0%
Cumulative Total			0	0.00	0.0%	

Easement Acreage²

20.66

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern ⁴	Areas or points (if too small to render as polygons at map scale).	1000 SF	Yellow Crosshatch	3	0.26	1.3%
5. Easement Encroachment Areas ³	Areas or points (if too small to render as polygons at map scale).	none	Red Simple Hatch	0	0.00	0.0%

- 1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.
- 2 = The acreage within the easement boundaries.
- 3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.
- 4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spoies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by EEP such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in red italics are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particularly for situations where the condition f
