Response to Monitoring Year 2 (2021) DMS Comments

Slingshot Mitigation Site Cape Fear River Basin – CU# 03030002 – Rockingham County DMS Project ID No. 100058 Contract # 7525

Comments Received (Black Text) & Responses (Blue Text)

 The monitoring summary's Site Maintenance Report table shows three instances of invasive and nuisance vegetation management during the monitoring period. The treatment locations should be shown on the CCPV as points or polygons and areas shown on Table 6.

Response: Invasive treatment areas have been included on the CCPV and Table 6.

- 2. Table 12 This Table should include the current cross sectional area, i.e., the LTOB cross sectional area. The "Cross Sectional Area Between End Pins" row could be replaced with LTOB cross sectional area. This should also be reported with the summary data associated with the cross section graphs. We also recommend displaying the LTOB on the graphs as a line instead of a point for easier comparison with Bankfull based on MYO XSA. Response: The row "Cross Sectional Area Between End Pins" was replaced with "LTOB Cross Sectional Area" in Table 12. Additionally, a row for LTOB Cross Sectional Area" was added to the cross-section figures. The point for LTOB on the graphs was replaced with a line.
- 3. Please include the excel workbook used to create Tables 9 & 10. Response: This Excel file is included in the digital submittal.
- 4. Please include the stream gauge figures in the report and send supporting soil temperature data with the resubmittal.

Response: Stream gauge graphs are included in the final PDF, and soil temperature data is located in the master groundwater gauge workbook.

 In Appendix E, please include a figure displaying the 30th and 70th percentile of monthly precipitation with the observed monthly precipitation, and submit the data used to create this figure. Response: This figure is included in Appendix E. The excel data used to create it is included in the digital submittal.

***Gauge data was updated to follow the growing season methodology approved in the mitigation plan.

Slingshot Year 2, 2021 Monitoring Summary

General Notes

- No encroachment was identified in Year 2
- No evidence of nuisance animal activity (i.e., beaver, heavy deer browsing, etc.) was observed.

Streams

• Stream monitoring data show that all stream channels and structures are stable.

Wetlands

• Ten of Eleven groundwater gauges met success for the Year 2 (2021) monitoring period. Wetland hydrology data is in Appendix E.

	Success	Criteria Achieved/M	ax Consecu	tive Days Durii	ng Growing Sea	ison (Percenta	ge)
Gauge	Year 1 (2020)	Year 2 (2021)	Year 3 (2022)	Year 4 (2023)	Year 5 (2024)	Year 6 (2025)	Year 7 (2026)
1	Yes 26 days (11.4%)	Yes 62 days (24.5%)					
2	Yes 61 days (26.8%)	Yes 253 days (100%)					
3	Yes 187 days (82.0%)	Yes 123 days (48.6%)					
4	Yes 187 days (82.0%)	Yes 178 days (70.4%)					
5	Yes 100 days (43.9%)	Yes 123 days (48.6%)					
6	Yes 127 days (55.7%)	Yes 143 days (56.5%)					
7	Yes 83 days (36.4%)	Yes 210 days (83.0%)					
8	Yes 29 days (12.7%)	Yes 71 days (28.0%)					
9	Yes 73 days (32.0%)	Yes 109 days (43.1%)					
10	No 4 days (1.8%)	No 5 days (2.0%)					
11*	Yes 46 days (20.2%)	Yes 151 days (59.7%)					

*Gauge 11 was installed in an area not previously identified for wetland reestablishment but appeared to be exhibiting wetland characteristics post-construction. During 2021 monitoring, the additional wetlands surrounding gauge 11 were delineated, resulting in approximately 0.52 acres of wetlands on-site that were not previously accounted for (Appendix F).

Vegetation

• Year 2 (2021) vegetation measurements occurred on October 21, 2021 and included 2 additional random sample plots (50-meter by 2-meter). Measurements of all 12 plots resulted in an average of 644 stems/acre excluding livestakes. Additionally, all permanent plots met success criteria, while transect 2 was two stems shy of success. (Tables 8-10, Appendix C).

1.0 PROJECT SUMMARY

Restoration Systems, LLC has established the North Carolina Division of Mitigation Services (NCDMS) Slingshot Mitigation Site (Site).

1.1 Project Goals & Objectives

Project goals were based on the *Cape Fear River Basin Restoration Priorities* (RBRP) report (NCEEP 2009) and on-site preconstruction data collection of channel morphology and function observed during field investigations. The Site is located within Targeted Local Watershed (TLW) 03030002010010. The RBRP report documents benthic ratings vary between "Fair" and "Good-Fair" possibly due to cattle, dairy, and poultry operations.

The project is located within the Troublesome Creek and Little Troublesome Creek Local Watershed Planning area (NCEEP 2004); project activities addressed priorities associated with the LWP and site-specific information following the LWP goals in parenthesis.

- 1. Protect and improve water quality by restoring wetland, stream, and riparian area functions and values, which may have been, or may be, lost through historic, current, and future impacts (4115 linear feet of stream restored/enhanced/preserved, 1.71 acres of wetland restored/enhanced, and 11.6. acres of riparian buffer restored/enhanced).
- 2. Achieve a net increase in riparian zone buffers and wetlands acreage, functions, and values (11.6 acres of riparian buffer were restored/enhanced, and wetland acreage was increased by 1.02 acres).
- 3. Promote a comprehensive approach for the protection of natural resources (protected the Site, streams, wetlands, and riparian buffer through a permanent conservation easement).

In addition to the defined Troublesome Creek LWP goals, additional goals for the area generally revolve around reducing stressors to water quality. Stressors and how each was addressed by project activities are as follows.

- Nutrient Inputs (livestock were removed from streams resulting in a direct reduction of 474.7 pounds of nitrogen, 39.3 pounds of phosphorus per year, and 4.7 x 10¹¹ colonies of fecal coliform; eliminated fertilizer applications; and installed marsh treatment areas).
- 2. Streambank Erosion (reduction of 220 tons of sediment per year).
- 3. Stormwater (reduced bank height ratios and installed marsh treatment area to reduce stormwater pulses).
- 4. Disturbed Riparian Buffer (restored/enhanced 11.6 acres of riparian buffer along 4115 linear feet of stream).
- 5. Floodplain Alteration (eliminated straightened, entrenched streams and removed spoil material deposited in the floodplain).

Site-specific mitigation goals and objectives were developed through the use of North Carolina Stream Assessment Method (NC SAM) and North Carolina Wetland Assessment Method (NC WAM) analyses of preconstruction and reference stream systems at the Site (NC SFAT 2015 and NC WFAT 2010) (see table below).

Stream/Wetland Targeted Functions, Goals, and Objectives

Targeted Functions	Goals	Objectives	Compatibility of Success Ci
(1) HYDROLOGY			
 (2) Flood Flow (Floodplain Access) (3) Streamside Area Attenuation (4) Floodplain Access (4) Wooded Riparian Buffer 	 Attenuate flood flow across the Site. Minimize downstream flooding to the maximum extent possible. Connect streams to functioning wetland systems. 	 Construct new channel at historic floodplain elevation to restore overbank flows and restore jurisdictional wetlands Plant woody riparian buffer Remove livestock Deep rip floodplain soils to reduce compaction and increase soil surface roughness Protect riparian buffers with a perpetual conservation easement 	 Over the monitoring point Document four overba Livestock excluded from Attain Wetland Hydrol
(3) Stream Stability (4) Sediment Transport	Increase stream stability within the Site	Construct channels with proper pattern, dimension, and longitudinal profile	 Cross-section measure substrate Visual documentation
(4) Stream Geomorphology	 so that channels are neither aggrading nor degrading. Remove livestock Construct stable channels with cobble/gravel substrate Plant woody riparian buffer 		 Over the monitoring period < 10% change in BHR of Livestock excluded from Attain Vegetation Succession
(1) WATER QUALITY			
(2) Streamside Area Vegetation			
(3) Upland Pollutant Filtration (2) Indicators of Stressors	• Remove direct nutrient and pollutant inputs from the Site and reduce contributions to downstream waters.	Remove livestock and reduce agricultural land/inputs Install marsh treatment areas, where necessary Plant woody riparian buffer	 Livestock excluded from Attain Wetland Hydrol Attain Vegetation Succ
Wetland Particulate Change		Restore/enhance jurisdictional wetlands adjacent to Site streams	
(1) НАВІТАТ			
(2) In-stream Habitat			
(3) Substrate			
(3) In-Stream Habitat		• Construct stable shannels with eachble (group) substrate	
(2) Stream-side Habitat		 Construct stable channels with cobble/gravel substrate Add large woody debris in the form of log vane structures 	Cross-section measure substrate
(3) Stream-side Habitat	 Improve instream and streamside habitat. 	 Plant permanent seed mixtures along banks to add rooting material and leafy vegetation for macroinvertebrates Plant woody riparian buffer to provide organic matter and shade 	Visual documentationAttain Wetland Hydrol
(3) Thermoregulation		 Protect riparian buffers with a perpetual conservation easement Restore/enhance jurisdictional wetlands adjacent to Site streams 	 Attain Vegetation Succ Conservation Easemen
Wetland Physical Structure			
Wetland Landscape Patch Structure			
Wetland Vegetation Composition

1.2 Project Background

The Slingshot Mitigation Site (hereafter referred to as the "Site") encompasses 11.6 acres of disturbed forest and livestock pasture along warm water, unnamed tributaries to Lake Hunt. The Site is located approximately 2 miles west of Reidsville, east of Lake Hunt, and north NC Highway 158 in Rockingham County (Figure 1, Appendix A).

Before construction, Site land use consisted of livestock pasture, hayfields, and disturbed forest. Livestock had unrestricted access to Site streams. A narrow riparian fringe had developed on the stream margins that was composed of opportunistic species, invasive species, and a few mature tree species. Approximately 55 percent of the stream channel was degraded, contributing to sediment export from the Site resulting from mechanical processes from livestock hoof shear. In addition, streamside wetlands were cleared and drained by channel downcutting, and land uses. Preconstruction Site conditions resulted in degraded water quality, a loss of aquatic habitat, reduced nutrient and sediment retention, and unstable channel characteristics (loss of horizontal flow vectors that maintain pools and an increase in erosive forces to channel bed and banks). Site restoration activities restored riffle-pool morphology, aided in energy dissipation, increased aquatic habitat, stabilized channel banks, and greatly reduced sediment loss from channel banks.

1.3 Project Components and Structure

Proposed Site restoration activities generated 3185 Stream Mitigation Units (SMUs) and 1.321 Riparian Wetland Mitigation Units (WMUs) as the result of the following.

- 2501 linear feet of Priority I stream restoration
- 587 linear feet of stream enhancement (Level I)
- 635 linear feet of stream enhancement (Level II)
- 391 linear feet of stream preservation
- 1.018 acre of riparian wetland restoration
- 0.606 acre of riparian wetland enhancement

Additional activities that occurred at the Site included the following.

• Planting 12.05 acres of the Site with 10,950 stems (planted species are included in Table 5 [Appendix C]).

Deviations from the construction plans included removing the left vane arm from the structure at station 05+63 on Slingshot Creek and removing the three log cross-vanes between station 03+00 and 04+00 on UT1 due to bedrock presence. No other deviations of significance occurred between construction plans and the as-built condition. In addition, no issues have arisen since construction occurred.

Site design was completed in November 2019. Construction started on March 13, 2020, and ended within a final walkthrough on April 30, 2020. The Site was also planted on April 30, 2020. Completed project activities, reporting history, completion dates, project contacts, and background information are summarized in Tables 1-4 (Appendix A).

1.4 Success Criteria

Project success criteria have been established per the October 24, 2016, NC Interagency Review Team *Wilmington District Stream and Wetland Compensatory Mitigation Update*. Monitoring and success criteria relate to project goals and objectives. From a mitigation perspective, several of the goals and

objectives are assumed to be functionally elevated by restoration activities without direct measurement. Other goals and objectives will be considered successful upon achieving success criteria. The following table summarizes Site success criteria.

Success Criteria

Streams

- All streams must maintain an Ordinary High-Water Mark (OHWM), per RGL 05-05.
- Bank height ratio (BHR) cannot exceed 1.2 at any measured cross-section over the monitoring period.
- BHR at any measured riffle cross-section should not change by more than 10% from baseline condition over the monitoring period.
- A minimum of 30-days continuous surface flow for intermittent streams.
- The stream project shall remain stable and all other performance standards shall be met through four separate bankfull events, occurring in separate years, during the monitoring years 1-7.

Wetland Hydrology

• Saturation or inundation within the upper 12 inches of the soil surface for, at a minimum, 10 percent of the growing season, during average climatic conditions. Note: Growing season length will be confirmed with a continuous recording temperature gauge that will measure from February to April each monitoring year.

Vegetation

- Within planted portions of the Site, a minimum of 320 stems per acre must be present at year 3; a minimum of 260 stems per acre must be present at year 5; and a minimum of 210 stems per acre must be present at year 7.
- Trees must average 7 feet in height at year 5, and 10 feet in height at year 7 in each plot.
- Planted and volunteer stems are counted, provided they are included in the approved planting list for the site; natural recruits not on the planting list may be considered by the IRT on a case-by-case basis.

Note: BHR will be calculated using procedures outlined in the latest approved guidance from NCDMS.

2.0 METHODS

Monitoring will be conducted by Axiom Environmental, Inc. Annual monitoring reports of the data collected will be submitted to the NCDMS by Restoration Systems no later than December 31 of each monitoring year data is collected. The monitoring schedule is summarized in the following table.

Monitoring Schedule

Resource	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7
Streams	Х	Х	Х		Х		Х
Wetlands	Х	Х	Х	Х	Х	Х	Х
Vegetation	Х	Х	Х		Х		Х
Macroinvertebrates			Х		Х		Х
Visual Assessment*	Х	Х	Х	Х	Х	Х	Х
Report Submittal	Х	Х	Х	Х	Х	Х	Х

*Visual Assessment will be complimented by permanent photographic points located at each permanent cross section and vegetation plot.

2.1 Monitoring

The monitoring parameters are summarized in the following table.

Monitoring Summary

		Stream Parameters		
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Stream Profile	Full longitudinal survey	As-built (unless otherwise required)	All restored stream channels	Graphic and tabular data.
Stream Dimension	Cross-sections	Years 1, 2, 3, 5, and 7	Total of 14 cross-sections on restored channels	Graphic and tabular data.
Channel Stability	Visual Assessments	Yearly	All restored stream channels	Areas of concern will be depicted on a plan view figure with a written assessment and photograph of the area included in the report.
	Additional Cross-sections	Yearly	Only if instability is documented during monitoring	Graphic and tabular data.
Stream Hydrology	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	Stream flow regime is not in question. However, surface water gauges and/or cameras will be used to document bankfull events.	NA
Bankfull Events	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	Surface water gauge on Slingshot Creek and UT 1	Surface water data for each monitoring period
Bankrull Events	Visual/Physical Evidence	Continuous through monitoring period	All restored stream channels	Visual evidence, photo documentation, and/or rain data.
Benthic "Qual 4" method described in Standard Operating Procedures for Collection and Analysis of Benthic Macroinvertebrates, Version 5.0 (NCDWR 2016) Preconstruction, Years 3, 5, and 7 during the "index period" referenced in Small Streams Biocriteria Development (NCDWQ 2009)		2 stations (one at the lower end of UT1 and one at the lower end of Slingshot Creek)	Results* will be presented on a site-by-site basis and will include a list of taxa collected, an enumeration of <i>Ephemeroptera, Plecoptera</i> , and <i>Tricopetera</i> taxa as well as Biotic Index values.	
	· · · · · ·	Wetland Parameters		
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Wetland Restoration Groundwater gauges Years 1, 2, 3, 4, 5, 6, and 7 throughout the year with the growing season defined as March 26-November 8		11 gauges spread throughout restored/enhanced wetlands	Soil temperature at the beginning of each monitoring period to verify the start of the growing season, groundwater and rain data for each monitoring period	
		Vegetation Parameter	rs	
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Vegetation establishment and vigor	Permanent vegetation plots 0.0247 acre (100 square meters) in size; CVS- EEP Protocol for Recording Vegetation, Version 4.2 (Lee et al. 2008)	As-built, Years 1, 2, 3, 5, and 7	10 plots spread across the Site	Species, height, planted vs. volunteer, stems/acre
	Annual random vegetation plots, 0.0247 acre (100 square meters) in size	As-built, Years 1, 2, 3, 5, and 7	2 plots randomly selected each year	Species and height

*Benthic Macroinvertebrate sampling data will not be tied to success criteria; however, the data may be used as a tool to observe positive gains to in-stream habitat

Stream Summary

All streams are functioning as designed, and no stream areas of concern were observed during year 2 (2021) monitoring. Stream morphology data is available in Appendix D.

Wetland Summary

Summary of Monitoring Period/Hydrology Success Criteria by Year

Year	Soil Temperatures/Date Bud Burst Documented	Monitoring Period Used for Determining Success	10 Percent of Monitoring Period
2020 (Year 1)	March 26, 2020*	March 26-November 8 (228 days)	23 days
2021 (Year 2)	March 1, 2021**	March 1-November 8 (253 days)	25 Days

* NRCS growing season used for MY1 (2020) since gauges and soil temperature logger were not installed until May 6, 2020.

** Growing season start date confirmed with soil temperature reading of 47.83°F on March 1, 2021 and dropping no lower than 41.96°F thereafter (Appendix E).

All groundwater gauges met success criteria for the year 2 (2021) monitoring period except Gauge 10 (Appendix E).

Vegetation Summary

During quantitative vegetation sampling, 10 sample plots (10-meter by 10-meter) were installed within the Site as per guidelines established in *CVS-EEP Protocol for Recording Vegetation, Version 4.2* (Lee et al. 2008). Year 2 (2021) vegetation measurements occurred on October 21, 2021, and included 2 additional random sample plots (50-meter by 2-meter). Measurements of all 12 plots resulted in an average of 644 stems/acre, excluding livestakes. Additionally, all permanent plots met success criteria, while transect 2 was two stems shy of success. (Tables 8-10, Appendix C).

Vegetation Condition Assessment

Slingshot

Planted Acreage ¹	9.3					
Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	None	0.1 acres	none	0	0.00	0.0%
2. Low Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
2B. Low Planted Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
			Total	0	0.00	0.0%
3. Areas of Poor Growth Rates or Vigor	None	0.25 acres	none	0	0.00	0.0%
	Cumulative Total			0	0.00	0.0%

		0		0	0.00	0.0 %
Easement Acreage ²	11.6					
Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern ⁴	Populations of cattail, kudzu, privet, multiflora rose, princess tree, and tree of heaven observed within the easement. All populations were treated during MY2 (2021).	1000 SF	yellow hatched polygons	13	4.57	39.4%
5. Easement Encroachment Areas ³	None	none	none	0	0.00	0.0%

= Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage crossings or any other elements not directly planted as part of the project effort.

2 = The acreage within the easement boundaries.

3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1.2 or 3) as well as a parallel tally in item 5.

4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by DMS such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in red italics are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particulalry for situations where the conditon for an area is somewhere between isolated specimens and dense, discreet patches. In any case, the point or polygon/area feature can be symbolized to describe things like high or low concern and species can be listed as a map inset, in legend items if the number of species are limited or in the narrative section of the executive summary.

Shaded cells indicate that these will typically not be filled in.

1 = The distributions for these parameters can include information from both the cross-section measurements and the longitudinal profile. 2 = For projects with a proximal USGS gauge in-line with the project reach (added bankfull verification - rare).

3. Utilizing XS measurement data produce an estimate of the bankfull floodplain area in acres, which should be the area from the top of bank to the toe of the terrace riser/slope.

4 = Proportion of reach exhibiting banks that are eroding based on the visual survey for comparison to monitoring data; 5. Of value/needed only if the n exceeds 3

Appendix E HYDROLOGY DATA

Table 15. Verification of Bankfull Events Stream Gauge Graphs Table 16. Groundwater Hydrology Data Soil Temperature Graph Figure E1. 30-70 Percentile Graph for Rainfall Groundwater Gauge Graphs

Table 15	Verification	of Bar	ıkfull	Events
----------	--------------	--------	--------	---------------

Date of Data Collection	Date of Occurrence	Method	Photo (if available)
June 3, 2020	May 21, 2020	Stream gauges and trail cameras captured a bankfull event after 5.37 inches of rain was documented between May 20th and 22nd, 2020 at an on-site rain gauge. Flow gauge recorded a stream stage of 2.15 feet.	1
November 18, 2020	November 12, 2020	Stream gauges and trail cameras captured a bankfull event after 3.1 inches of rain was documented between November 10th and 13th, 2020 at an on-site rain gauge. Flow gauge recorded a stream stage of 2.94 feet.	2, 3
February 25, 2021	February 15. 2021	Wrack was observed along the floodplain of Slingshot Creek and the crest gauge captured a bankfull event after 2.31 inches of rain was documented between February 12th and 15th, 2021 at an on-site rain gauge. The trail camera was damaged by the accompanying ice storm. Flow gauge recorded a stream stage of 1.45 feet.	4
March 27, 2021	March 2, 2021	Stream gauges and trail cameras captured Slingshot Creek receding from a bankfull event after 1.45 inches of rain was documented between March 26th and 27th, 2021 at an on- site rain gauge. Flow gauge recorded a stream stage of 1.10 feet.	5

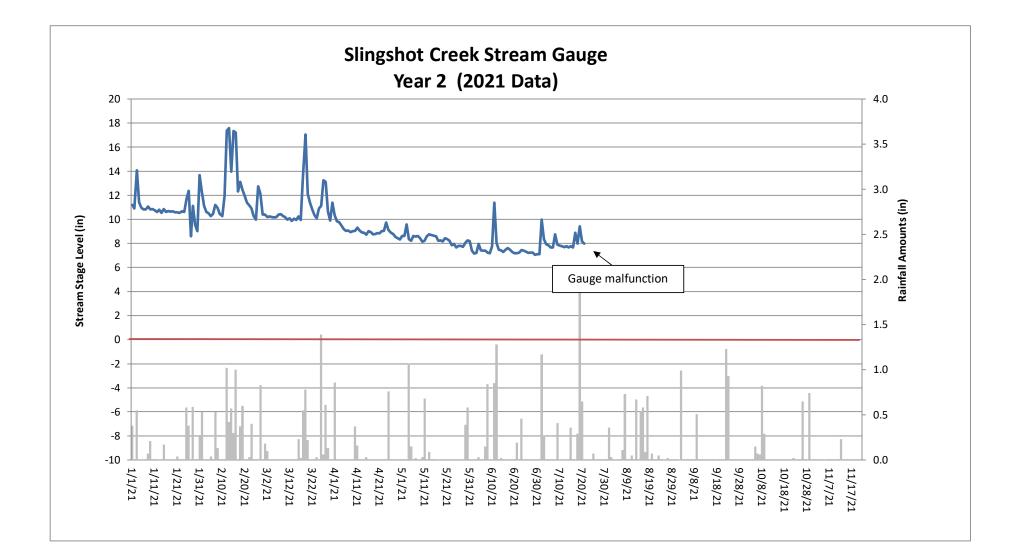

MY2 Monitoring Report (Project No. 100058) Slingshot Mitigation Site Rockingham County, North Carolina Appendices Restoration Systems, LLC January 2022

9	Yes 73 days (32.0%)	Yes 109 days (43.1%)					
10	No 4 days (1.8%)	No 5 days (2.0%)					
11*	Yes 46 days (20.2%)	Yes 151 days (59.7%)					

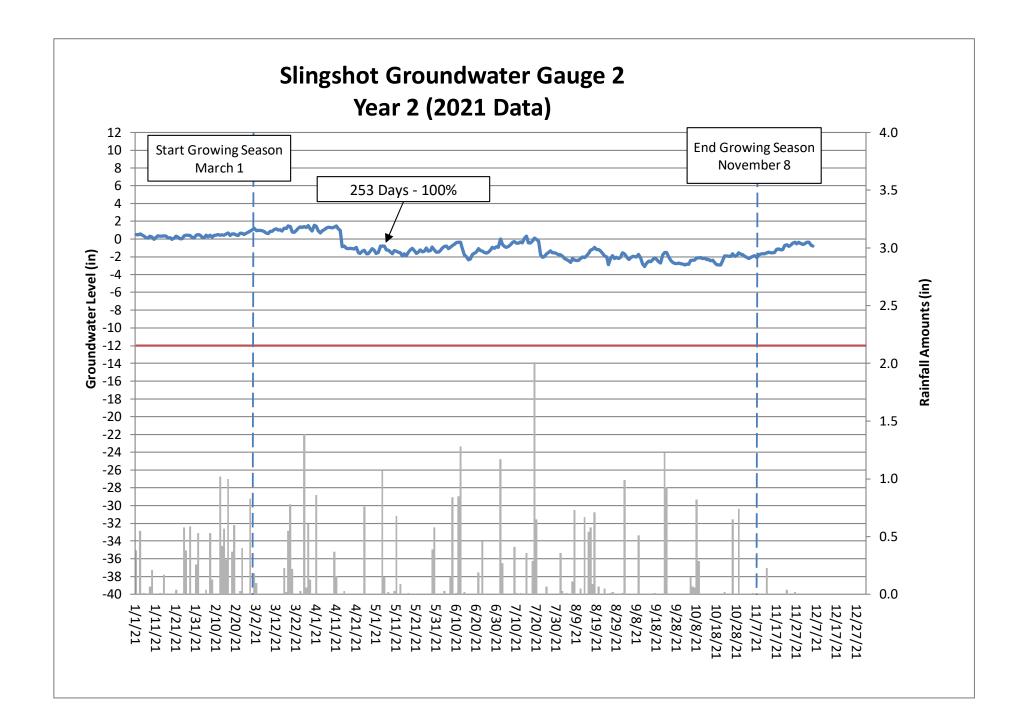

Table 16. Groundwater Hydrology Data

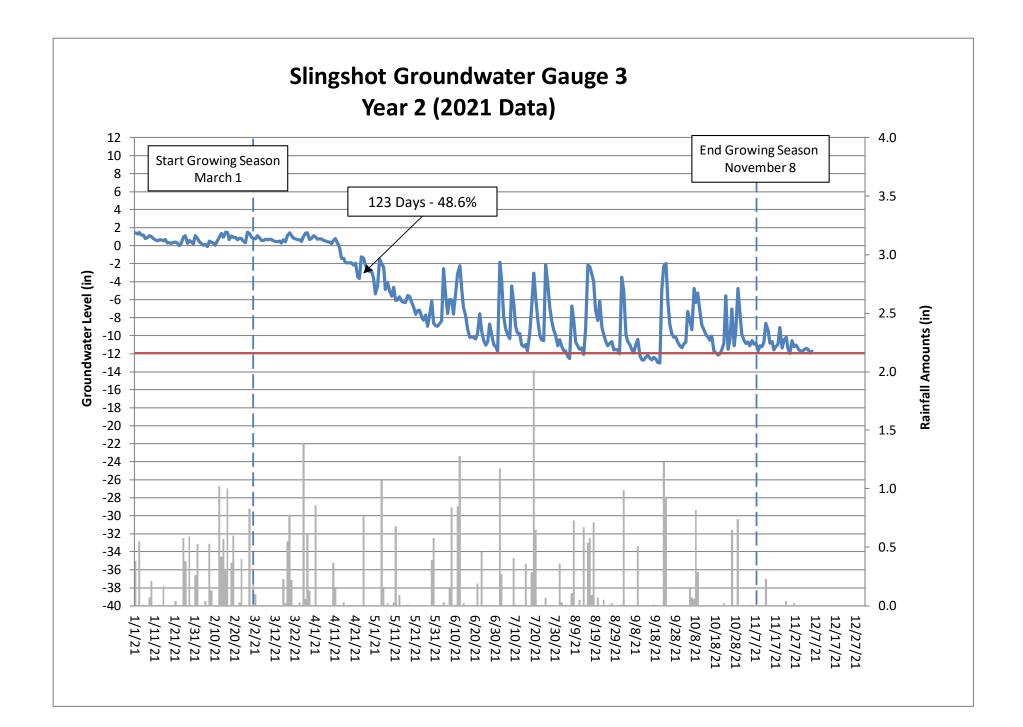

*Gauge 11 was installed in an area not previously identified for wetland reestablishment but appeared to be exhibiting wetland characteristics post-construction. During 2021 monitoring, the additional wetlands surrounding gauge 11 were delineated, resulting in approximately 0.52 acres of wetlands on-site that were not previously accounted for (Appendix F).

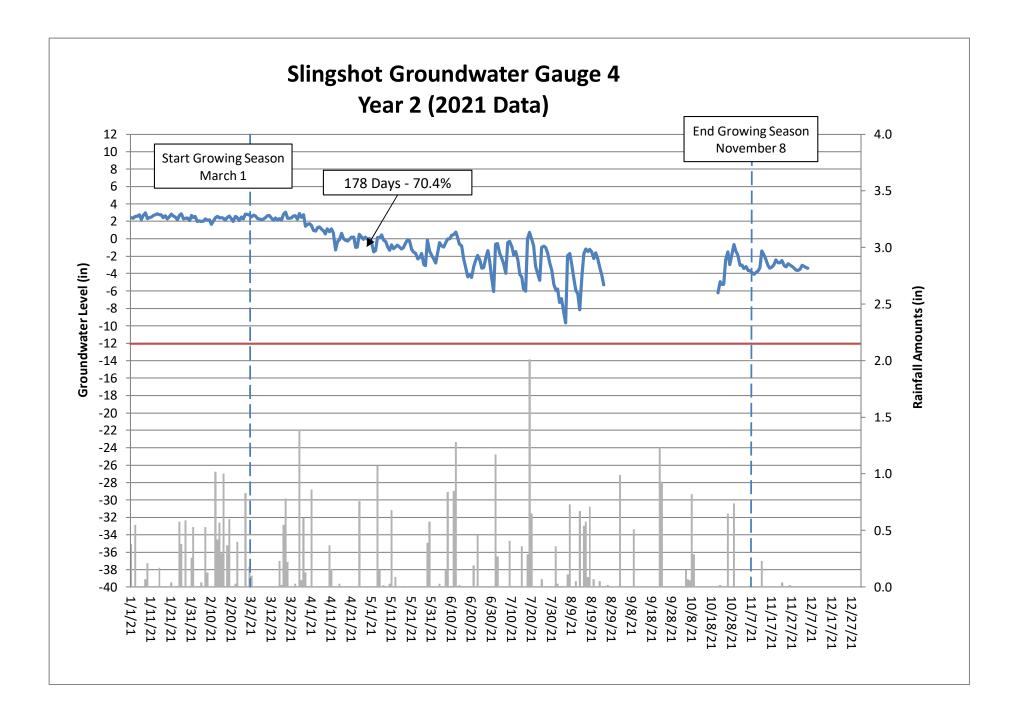

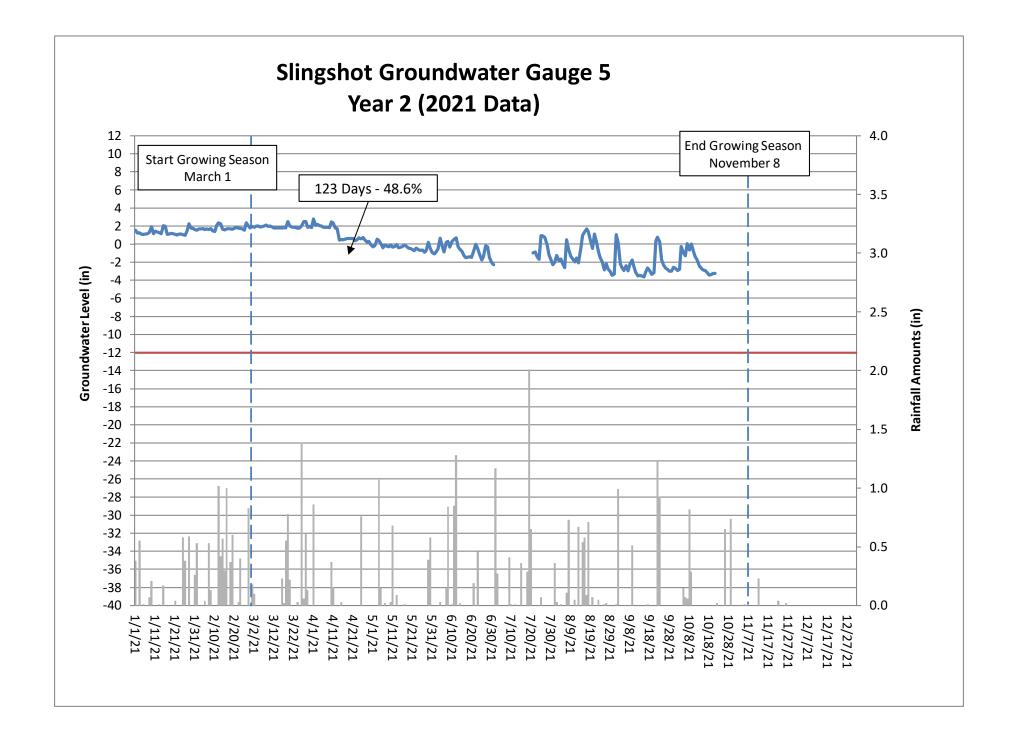

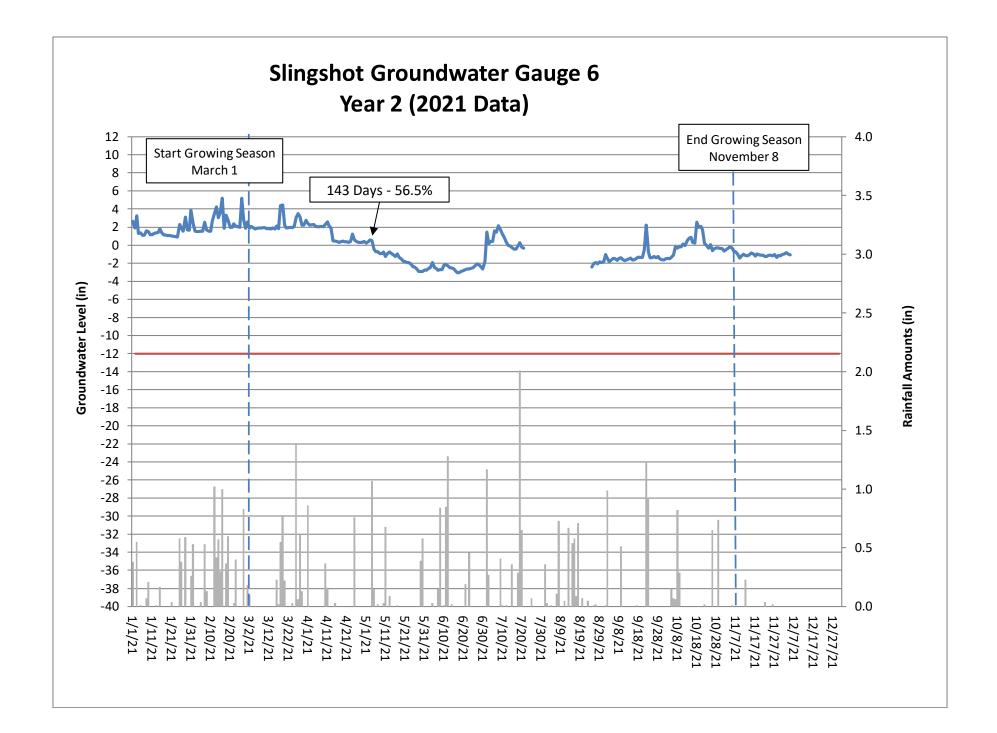

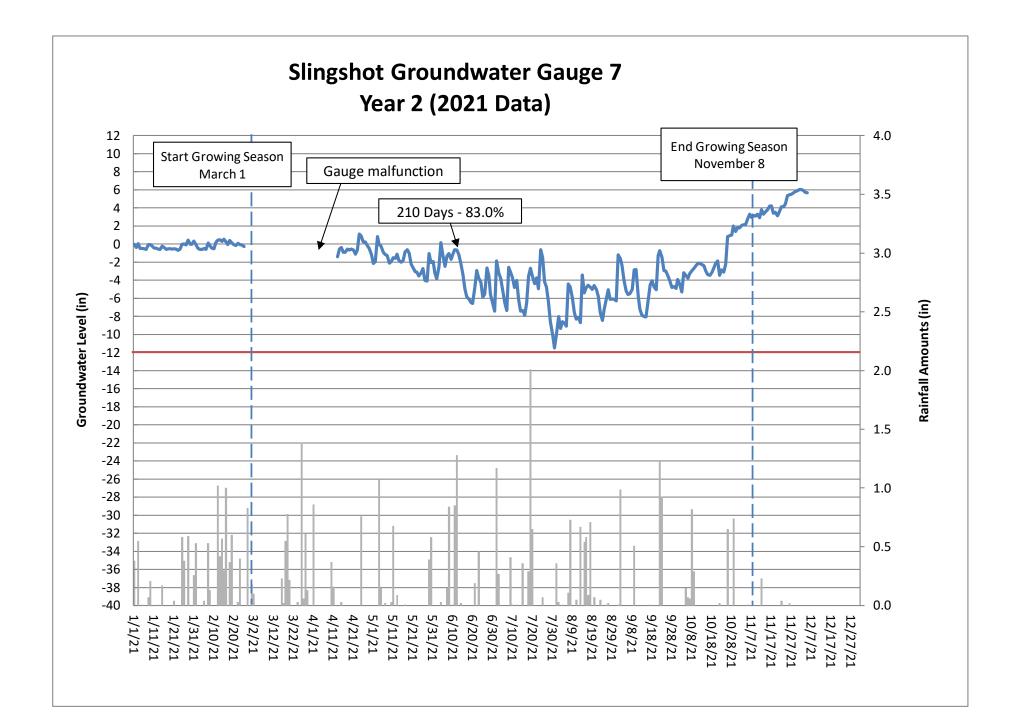

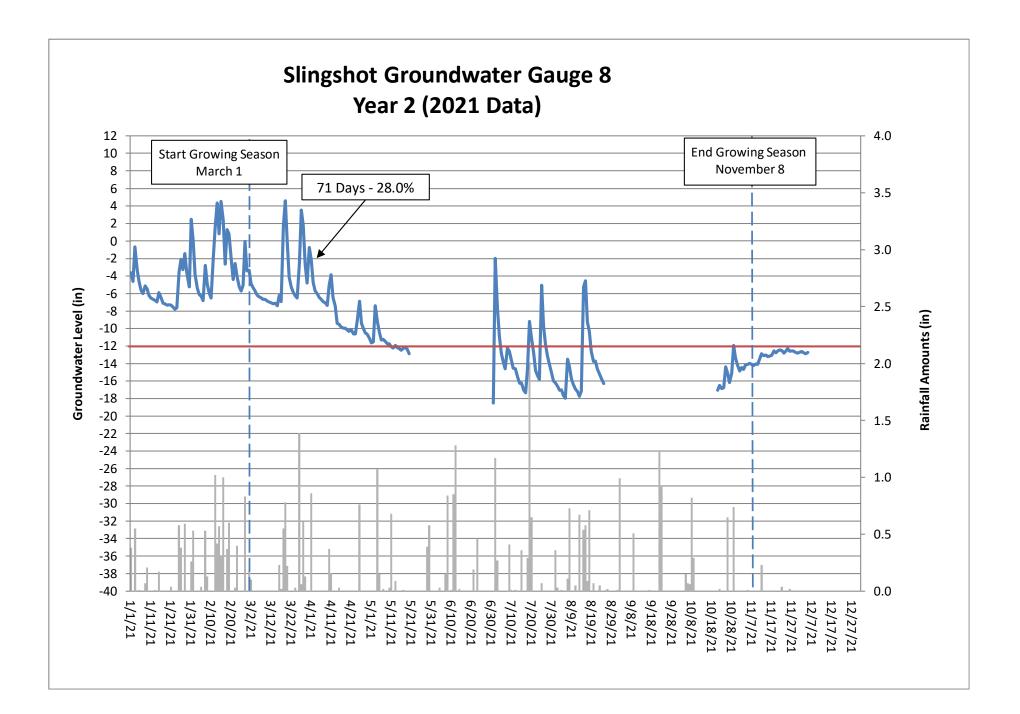

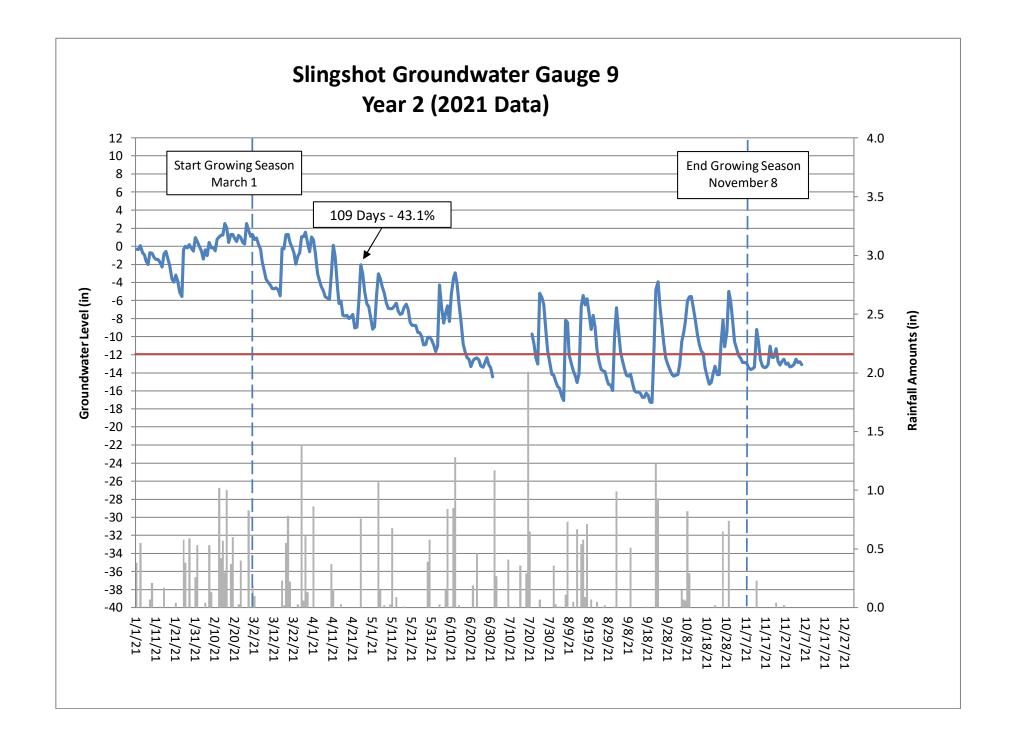

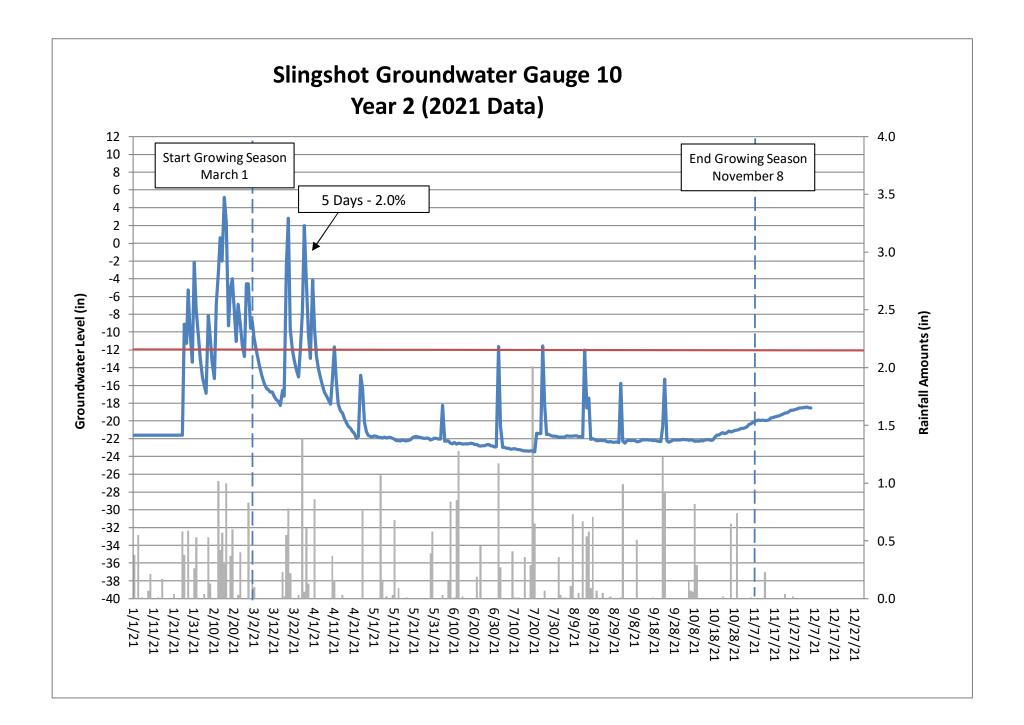

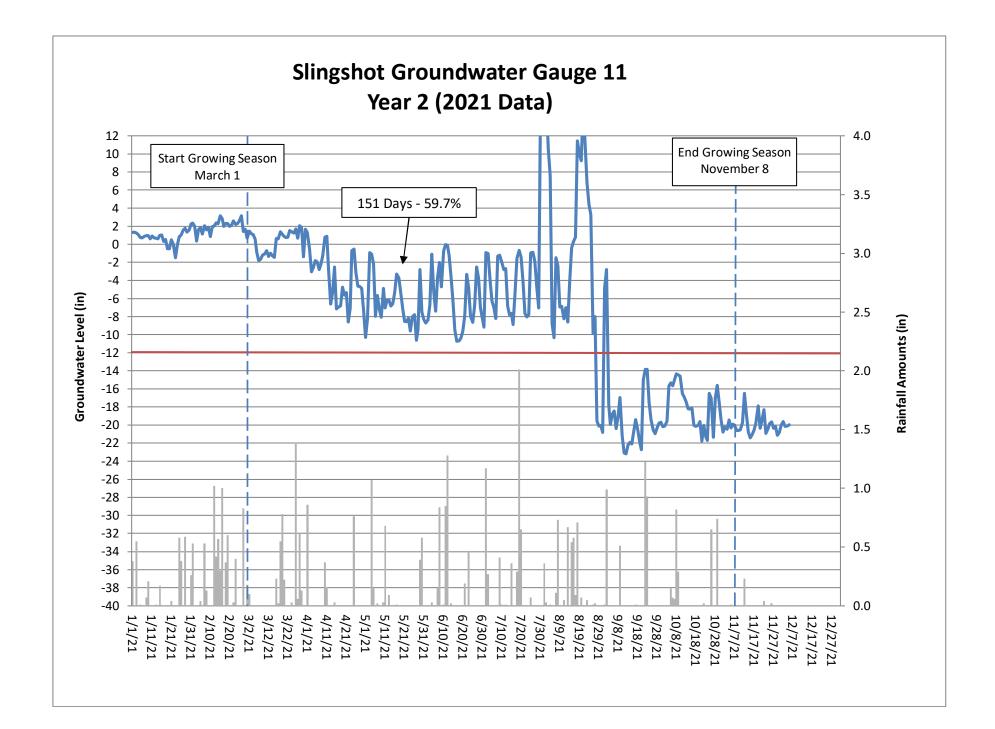

Appendix F WETLAND STUDIES

Figure F-1. Site Wetlands Overview

To further provide an understanding of the Site's wetland mitigation assets, RS mapped the additional wetland areas in the vicinity of Gauge 11 and along Slingshot Creek in the middle portion of the Site. Gauge 11 was installed in an area that was not previously identified for wetland reestablishment but appeared to be exhibiting wetland characteristics post-construction. Groundwater data for monitoring years 1 and 2 indicate that this area is trending toward successful wetland reestablishment of 0.52 acres.
