## I. INTRODUCTION

E.H. Pechan & Associates, Inc. (Pechan) is supporting the Southeastern States Air Resource Managers, Inc. (SESARM) in the Southeastern Modeling, Analysis, and Planning (SEMAP) project that is funded by the same ten states originally involved in the Visibility Improvement – State and Tribal Association of the Southeast (VISTAS) project. The SEMAP project addresses the next phase of ozone, fine particle, and regional haze assessment obligations of the SESARM member states. The SEMAP project is designed to produce technical analyses to aid the participating agencies in developing State Implementation Plans (SIPs) required by the Clean Air Act.

Pechan developed a set of draft 2007 area and nonroad source base year inventory emission estimates (Pechan, 2010). These estimates are reported by county and source classification code (SCC). These emissions inventories were developed using data from a number of sources:

- State/local (S/L) agency emissions data;
- 2007 year emissions data compiled from running EPA's NONROAD model with a combination of EPA default and S/L agency-supplied inputs;
- 2007 area source emissions estimated by Pechan, generally developed using the emissions estimation procedures used to prepare EPA's draft 2008 National Emissions Inventory (NEI);<sup>1</sup>
- 2008 commercial marine vessel and aircraft emission estimates from EPA's draft 2008 NEI, modified by Pechan to reflect 2007 activity levels;
- 2007 Class I line-haul locomotive emission estimates provided by the Eastern Regional Technical Advisory Committee (ERTAC);
- 2008 ERTAC Class II/III line-haul locomotive emission estimates, modified by Pechan to reflect 2007 activity levels; and
- Emission estimates carried forward or grown from EPA's 2002 area source NEI.<sup>2</sup>

This final inventory incorporates the following information into the draft 2007 area/nonroad source inventory:

1. Additional S/L agency data and comments to revise/remove emission estimates reported in the draft inventory;
2. 2007 ERTAC switchyard locomotive emission estimates; and
3. Effects of point source subtractions on source categories for which draft area source emission estimates reflect total emissions activity (e.g., industrial natural gas combustion).

The following sections provide additional details on the inventory development process. The major topics that are discussed are:

---

<sup>1</sup> 2008 NEI methods rely on Eastern Regional Technical Advisory Committee (ERTAC) methods when available.

<sup>2</sup> Based on direction from S/L agencies, some 2002 NEI emission estimates were projected to 2007 using emission activity growth factors from Version 5.0 of the Economic Growth Analysis System (EGAS) (EPA, 2010).

- How Pechan identified source categories and/or pollutants that may be missing from the S/L agency supplied data;
- How Pechan integrated data from the various emission data sources (i.e., S/L agencies, Pechan defaults, ERTAC, and 2008 and 2002 NEI); and
- How Pechan quality assured the integrated emissions inventory.

The balance of this report is organized as follows. Section II describes the development of the stationary area source sector inventory. The development of the nonroad mobile source sector inventory is described in Section III. Section IV presents the area and nonroad source emission summaries for the final 2007 base year inventory for the SEMAP project. Section V presents the references that were consulted in preparing the final inventory in support of the SEMAP project.

## II. STATIONARY AREA SOURCE SECTOR INVENTORY

Pechan developed a final 2007 base year area source inventory for the SEMAP project from a combination of four data sources:

- 1) State/Local agency supplied area source emissions data;
- 2) Pechan 2007 area source emission estimates developed using the emission estimation methods from the 2008 NEI with adjustments to reflect 2007 emissions activity and to subtract point source emissions;
- 3) Pechan 2007 industrial and commercial/institutional fuel combustion area source emission estimates specifically developed for the SESARM states; and
- 4) Area source emission estimates carried forward or grown from EPA's 2002 nonpoint source NEI.

Table II-1 summarizes how these data sources were merged to create a comprehensive stationary area source inventory for jurisdictions covered by the SEMAP project. Although a separate fire emissions inventory is being developed by another contractor, in some cases S/L agencies requested that emissions for certain fire categories be included in our stationary area source inventory. The last row of Table II-1 summarizes S/L agency instructions related to Pechan generating emission estimates for certain fire source categories in this stationary area source inventory. The following sections provide more specifics on the contents of each of these data sources and how they were combined into the final 2007 area source inventory.

### A. AGENCY SUPPLIED INVENTORY DATA

Last Fall, Pechan commenced area source inventory development work by providing S/L agencies with a Technical Memorandum documenting the emission estimation methods and data Pechan was using to develop the U.S. Environmental Protection Agency (EPA)'s 2008 nonpoint source NEI (Pechan, 2009a). The purpose of this memorandum was to provide agencies with information to: (1) review and comment on the methods/data, and (2) assist agencies in evaluating the merits of the NEI methods/data relative to any S/L area source inventory development efforts. State and local agencies were then provided with several months to compile and transmit area source emissions data to Pechan.

Two state agencies (North Carolina and Virginia) and two local agencies (Jefferson County, Kentucky and Davidson County, Tennessee) provided area source data for the draft area source inventory (two additional local agencies provided data for the final area source inventory – Knox County and Shelby County, Tennessee). After receiving these S/L agency data, Pechan compared the source classification code (SCC) and pollutant coverage of these submittals against the SCCs/pollutants in the 2007 emissions data that Pechan was developing for this project (hereafter referred to as the "Pechan default inventory").

To assist in obtaining direction from SESARM agencies on how to merge the data from these sources, Pechan first identified the SCC/pollutant combinations in the Pechan default inventory that matched to S/L agency data. Next, Pechan reviewed remaining S/L agency SCC/pollutant combinations against Pechan defaults to identify whether it may be possible that these emissions

Table II-1. Overview of Area Source Inventory Components by State/Local Agency

Agency Contact	Alabama	Florida	Georgia	Kentucky-Jefferson County	Kentucky-Rest of State	Mississippi	North Carolina	South Carolina	Tennessee-Davidson County	Tennessee-Knox County	Tennessee-Shelby County	Tennessee-Rest of State	Virginia	West Virginia
Area Source Emissions Data	Lisa Cole Combination of Agency data and Pechan defaults, supplemented with carry-forward categories from 2002 NEI	Kelly Stevens Pechan defaults, supplemented with carry-forward categories from 2002 NEI (certain SCCs treated as majority of other states; combination of EGAS and carry forward)	Byeong Kim Pechan defaults, supplemented with carry-forward categories from 2005 GA CERR submission grown using EGAS	Craig Butler Combination of Agency data and Pechan defaults	Martin Luther Pechan defaults, supplemented with carry-forward categories from 2002 NEI grown using EGAS	Elliott Bickerstaff Pechan defaults, supplemented with carry-forward categories from 2002 NEI (some categories grown using EGAS, others carried forward)	Phyllis Jones Combination of Agency data and Pechan defaults	Carla Bedenbaugh Pechan defaults, supplemented with carry-forward categories from 2002 NEI grown using EGAS	John Finke Combination of Agency data and Pechan defaults	Steve McDaniel Combination of Agency data and Pechan defaults, supplemented with carry-forward categories from 2002 NEI	Chris Boyd Combination of Agency data and Pechan defaults, supplemented with carry-forward categories from 2002 NEI	Amarda Davis Combination of Agency data (2 SCCs only) and Pechan defaults, supplemented with carry-forward categories from 2002 NEI	Thomas Foster Combination of Agency data and Pechan defaults, supplemented with carry-forward categories from 2002 NEI	Bob Belterton Combination of Agency data (Mining and Quarrying only) and Pechan defaults, supplemented with carry-forward categories from 2002 NEI
Handling of Fire Source Categories	Include Land Clearing Debris Burning in area inventory			Include Land Clearing Debris Burning in area inventory			Do not include Land Clearing Debris estimates. Do not delete Agricultural Burning emission estimates.	Include all NEI-based burning categories (e.g., Land Clearing Debris and Residential Waste)			Include Agency Land Clearing Debris estimates.	Include Agency Land Clearing Debris estimates.	Include Land Clearing Debris Burning estimates in area inventory (such burning area inventory is prohibited)	Do not include Land Clearing Debris Burning (such burning is prohibited)

were covered in the Pechan default inventory under different SCCs. Pechan then developed a list of potential indirect matches between the two data sets for agency review. This list was compiled in an Excel worksheet. Next, Pechan developed a separate worksheet that listed SCC/pollutant combinations in the S/L supplied area source inventory that we were unable to either directly or indirectly match to combinations in the Pechan default inventory. A list of SCC/pollutant combinations in the Pechan default inventory that we were unable to directly or indirectly match to combinations in the S/L agency inventory was also prepared in a separate worksheet. Finally, Pechan developed a worksheet that contained all S/L agency inventory SCC/pollutant combinations with emissions equal to "0." The above worksheets were saved in a single Excel workbook for each Agency. In addition to these workbooks, Pechan transmitted a Word document identifying questions on how to merge the two data sets (e.g., where S/L agency emissions are reported as zero, should Pechan replace any of these with emissions from the Pechan default inventory?). After reviewing S/L agency responses to these questions, Pechan transmitted any follow-up questions that were necessary to clarify S/L agency guidance.

## **B. DEVELOPMENT OF PECHAN DEFAULT 2007 AREA SOURCE INVENTORY**

Pechan created a default 2007 area source inventory that includes all of the source categories covered by the 2008 nonpoint source NEI. For all source categories except industrial and commercial/institutional (ICI) fuel combustion, Pechan either directly incorporated emissions data from the 2008 nonpoint source NEI (when the NEI represented use of 2007 emissions activity data), or recalculated the NEI emission estimates to reflect 2007 activity levels (when the NEI reflected 2006 or 2008 activity levels) and/or to remove emissions associated with activity reflected in the point source inventory. For ICI fuel combustion, the 2008 nonpoint source NEI only developed emissions activity estimates, not emission estimates. Because of the potential importance of these source categories and the availability of methodological improvements, Pechan utilized an emissions estimation method for ICI fuel combustion that is incorporates a few refinements to the NEI method. The following section discusses how information from the 2008 nonpoint source NEI was used in this project. The subsequent section provides details on the ICI fuel combustion emissions estimation methods.

### **1. Nonpoint Source NEI**

Pechan is supporting EPA efforts to develop the 2008 nonpoint source NEI. Because of data availability issues, the 2008 NEI is comprised of data of various vintages (2006-2008). Table II-2 provides documentation of the 2008 nonpoint source NEI as follows:

- (1) Source Category – identifies the name of each general source category covered.
- (2) Source Classification Code(s) – lists the SCCs that are inventoried.
- (3) Source Classification Code Description – provides a description of each SCC.

- (5) Link to Emission Calculation Workbook – provides a link to the draft 2008 NEI emissions or activity data;
- (6) Year of Activity Data – identifies the year represented by the emissions activity data; and
- (7) Point Source Component – signifies whether a portion of the source category’s emissions may be included within the point source inventory.

**a. *Adjustment of NEI Data to Reflect 2007 Activity Levels***

Where the 2008 nonpoint source NEI reflects 2007 activity data, Pechan incorporated the 2008 NEI emission estimates into the Pechan default inventory for this project. When a source category’s NEI data reflect 2006 or 2008 emissions activity data, Pechan updated the NEI estimates to reflect 2007 emission activity levels. Table II-3 documents the specific revisions that were implemented.

For many area source categories, emissions activity data are not available at the county-level. In these cases, county-level emissions are estimated using two sets of activity data: one set reflecting state or regional-level emissions activity (e.g., volume of natural gas consumed by the residential sector in each state), and the other set representing data that are used to allocate emissions activity to the county-level (e.g., number of houses using natural gas as the primary heating fuel in each county). Specifically, the “Backcasting or Forecasting Methodology” column in Table II-3 presents the approach used to update emissions activity data to represent 2007, and the “County Allocation Method” column identifies the approach used to update the county allocation data. As noted in Table II-3, all county allocation data were not updated to 2007. This approach was taken because of the level-of-effort that would be involved in updating some of the allocation data, and the fact that these data are often not expected to differ significantly from year-to-year.

**b. *Adjustment of NEI Data to Remove Activity Reflected in the Point Source Inventory***

To prevent double-counting of emissions in the stationary point source and area source emissions inventories, it was necessary to perform point source subtractions on some of the source categories in the Pechan default inventory. To facilitate the point source subtractions, Pechan prepared crosswalks that link area SCCs to point SCCs. These crosswalks are presented in Appendix A. The general point source subtraction approach consisted of the following steps:

1. Compile 2007 point source emissions and control efficiency data provided by each state for the applicable point SCCs.
2. Identify potential quality assurance issues for S/L agency review;
3. Revise control efficiency data to incorporate S/L agency comments;

4. Back-calculate 2007 uncontrolled point source emissions from reported emissions and control efficiency data -- e.g., 40 tpy of controlled NO<sub>x</sub> emissions and 80% control efficiency = 50 tpy of uncontrolled NO<sub>x</sub> emissions.
5. Sum the emissions for each record from step 4 to the state-level to yield state total uncontrolled point source emissions by pollutant.
6. For each pollutant and state, compute the fraction of total 2007 state-level emissions in the 2007 Pechan default inventory represented by area sources (using step 5 total point source uncontrolled emissions).
7. Multiply the emission estimates in the draft base year inventory by the appropriate percentages in step 6 to yield area source emissions.

With the exception of Georgia, Pechan performed the point source subtractions at the state-rather than county-level because of the uncertainty associated with the NEI county emission allocations in that actual county-level emissions activity data are generally not available (i.e., a surrogate indicator such as employment is typically used to allocate state-level activity to counties).<sup>4</sup> However, at Georgia's request, Pechan performed Georgia's point source subtractions at the county-level.

As part of step 2, Pechan identified a significant number of PM-PRI and PM-FIL point source control efficiency records. These data could not be directly used in the point source subtraction procedure because all point source emissions data are provided for PM10, PM2.5, or PM-CON. For the PM-FIL records, Pechan was able to use EPA's PM calculator database to compile PM10-FIL and PM2.5-FIL control efficiency values.<sup>5</sup> Pechan specifically linked the PM calculator database's PM10-FIL and PM2.5-FIL emission control efficiency values to SEMAP point source inventory PM-FIL control efficiency records using the SCCs and emissions control device codes that are reported in the SEMAP inventory. These control efficiency values were then applied to the point source PM10-FIL and PM2.5-FIL emission records to estimate uncontrolled PM10-FIL and PM2.5-FIL emissions. In lieu of any better information, we assumed that the PM-FIL control efficiencies had no effect on PM-CON emissions. Pechan then summed the estimated uncontrolled PM10-FIL and PM2.5-FIL emissions with the PM-CON emissions to estimate uncontrolled point source PM10-PRI and PM2.5-PRI emissions. This procedure yielded uncontrolled emission estimates for all six PM species.

Because of the inconsistent reporting of throughput data in the SEMAP point source inventory, throughput data were used in the point source subtraction procedure in only a limited number of cases. These cases are listed below in Table II-4. For these areas/SCCs, all pollutants' total emissions are adjusted by the same percentage. For a few area source categories, it was necessary to incorporate source category-specific point source subtraction procedures. Appendix A summarizes the specific point source subtraction approaches for these source categories.

---

<sup>4</sup> Efforts to perform subtractions at the county-level commonly result in negative emission estimates.

<sup>5</sup> Because the PM calculator database requires PM-FIL input data., it was not possible to use the PM-PRI control efficiency records to estimate uncontrolled emissions.

## 2. Estimation of Area Source Emissions from Industrial and Commercial/Institutional Fuel Combustion

Currently, the 2008 NEI data for the ICI fuel combustion categories represent *total emission activity* estimates, rather than *area source emission* estimates. Because emission estimates are not available and because of the relative importance of this category, Pechan recommended that 2007 ICI combustion area source emission estimates be developed as part of this project. This section documents the emission inventory development methodology that Pechan used in preparing 2007 year ICI fuel combustion area source emission estimates for the SESARM states. The following are elements of the methodology that provide improvements over the 2008 NEI methodology:

- Obtained Industrial and Commercial/Institutional energy consumption by fuel type and SESARM state for the year 2007 from the Energy Information Administration (EIA)'s State Energy Data System (SEDS) – the 2008 NEI uses 2006 year data;
- Obtained geographic- and year-specific estimates of non-fuel use consumption of industrial energy from the 2006 Manufacturing Energy Consumption Survey (MECS) – the 2008 NEI uses data from the 2002 MECS survey;
- Applied a county allocation procedure that reflects the energy-intensity of each industrial sector – the 2008 NEI methods only reflect the number of employees in each sector; and

- Updated SO<sub>2</sub> emission factors to reflect coal sulfur content estimates for coal used in the industrial sector in 2007 – a recent review of industrial coal sulfur content values concluded that the NEI values are based on unrepresentative data (Pechan, 2009b).

Table II-5 identifies the SCCs for which Pechan prepared ICI fuel combustion area source emission estimates. The key data inputs in the emissions estimation methodology are:

1. Total Industrial and total Commercial/Institutional energy consumption by fuel type and SESARM state for the year 2007;
2. Estimates of the percentage of total ICI distillate fuel and liquefied petroleum gas (LPG) consumption from stationary sources;
3. Industrial energy consumption used for non-fuel purposes by fuel type and state in 2006;
4. ICI energy consumption by fuel type for point sources by SESARM state in year 2007;
5. Emission factors relating emission rates to volume of energy consumed by fuel type for the ICI sectors;
6. Sulfur content of coal consumed in the ICI sectors by state in year 2007;
7. County-level Industrial sector energy consumption estimates by state for year 2007; and
8. County-level Commercial/Institutional sector employment by state for the year 2006.<sup>6</sup>

**Table II.5. ICI Fuel Combustion Area Source Classification Codes**

SCC	DESCRIPTION
2102001000	Stationary Source Fuel Combustion; Industrial; Anthracite Coal; Total: All Boiler Types
2102002000	Stationary Source Fuel Combustion; Industrial; Bituminous/Subbituminous Coal; Total: All Boiler Types
2102004000	Stationary Source Fuel Combustion; Industrial; Distillate Oil; Total: Boilers and IC Engines
2102005000	Stationary Source Fuel Combustion; Industrial; Residual Oil; Total: All Boiler Types
2102006000	Stationary Source Fuel Combustion; Industrial; Natural Gas; Total: Boilers and IC Engines
2102007000	Stationary Source Fuel Combustion; Industrial; Liquid Petroleum Gas; Total: All Boiler Types
2102008000	Stationary Source Fuel Combustion; Industrial; Wood; Total: All Boiler Types
2102011000	Stationary Source Fuel Combustion; Industrial; Kerosene; Total: All Boiler Types
2103001000	Stationary Source Fuel Combustion; Commercial/Institutional; Anthracite Coal; Total: All Boiler Types
2103002000	Stationary Source Fuel Combustion; Commercial/Institutional; Bituminous/Subbituminous Coal; Total: All Boiler Types
2103004000	Stationary Source Fuel Combustion; Commercial/Institutional; Distillate Oil; Total: Boilers and IC Engines
2103005000	Stationary Source Fuel Combustion; Commercial/Institutional; Residual Oil; Total: All Boiler Types
2103006000	Stationary Source Fuel Combustion; Commercial/Institutional; Natural Gas; Total: Boilers and IC Engines
2103007000	Stationary Source Fuel Combustion; Commercial/Institutional; Liquid Petroleum Gas; Total: All Combustor Types
2103008000	Stationary Source Fuel Combustion; Commercial/Institutional; Wood; Total: All Boiler Types
2103011000	Stationary Source Fuel Combustion; Commercial/Institutional; Kerosene; Total: All Combustor Types

<sup>6</sup> To conserve project resources, Pechan will rely on 2006 employment data compiled in support of the 2008 NEI rather than develop 2007 employment data (note that year-to-year county employment proportions are expected to remain relatively constant).

The following sections describe the methodology/data source(s) for developing each of these data inputs, and the source(s) of information for each of these data elements. In selecting the information sources for each of these data elements, Pechan evaluated the completeness, representativeness, comparability, and accuracy criteria identified in the Quality Assurance Project Plan (QAPP) for this project. For example, information sources that provide data specific to the source category/geography/inventory period were selected over those that were less specific.

**a. Total ICI Energy Consumption**

For total Industrial and total Commercial/Institutional energy consumption by fuel type/state, Pechan primarily used the same source that EPA uses in developing ICI combustion emission estimates for the NEI—EIA’s SEDS (EIA, 2009a). The SEDS provides total energy consumption estimates by sector, state, fuel type, and year. To facilitate use with the criteria pollutant emission factors, Pechan compiled the SEDS energy consumption data in both sets of units provided by the EIA: physical units and British thermal units (Btus). For estimates of industrial distillate consumption, Pechan relied on estimates reported in EIA’s “Fuel Oil and Kerosene Sales” (EIA, 2009b). This source is preferred over the SEDS data because it provides additional sectoral detail that is needed to perform the stationary source energy consumption adjustments described below.

**b. Stationary Source Energy Consumption**

To avoid double-counting with energy consumption accounted for in mobile source inventories, it was necessary to adjust 2007 year SEDS distillate and LPG consumption estimates for mobile source fuel consumption. For LPG, the adjustments account for energy consumption reflected in the nonroad mobile sector. The adjustments were performed by subtracting estimated proportions of total Industrial sector and Commercial sector consumption computed from a national NONROAD model run. Pechan compiled national LPG consumption estimates for relevant SCCs from a 2006 run of EPA’s NONROAD model (a 2006 run was performed in support of the NEI—it is not anticipated that the percentages differ considerably between 2006 and 2007). Table II-6 identifies a complete list of nonroad SCCs associated with Industrial and Commercial sector LPG. The shaded entries in this table indicate where NONROAD reports LPG consumption. This procedure estimates that nonroad mobile sources account for 9 percent of Industrial sector, and 18 percent of Commercial sector LPG consumption. The SEDS LPG consumption estimates for each state/sector were adjusted downward using these percentages.

For distillate oil, it was necessary to remove energy consumption reflected in onroad/nonroad mobile source emission inventories. To facilitate this step, Pechan used more detailed distillate fuel consumption estimates reported in EIA’s “Fuel Oil and Kerosene Sales,” and stationary source fuel consumption percentage assumptions used in the regulatory impact analysis for EPA’s nonroad diesel emissions rulemaking (EPA, 2003a). Table II-7 displays the assumptions that were applied to the state-level Industrial sector distillate fuel consumption estimates reported in “Fuel Oil and Kerosene Sales” to estimate Industrial sector stationary source consumption. Table II-8 identifies the assumptions that were applied to estimate total stationary source Commercial/Institutional sector consumption.

**Table II-7. Assumptions Used to Estimate Industrial Sector Stationary Source Distillate Fuel Consumption**

Sector	Distillate Fuel Type	% of Total Consumption from Stationary Sources
Industrial	No. 1 Distillate Fuel Oil	60
	No. 2 Distillate Fuel Oil	100
	No. 2 Distillate/Low and High Sulfur Diesel	15 <sup>a</sup>
	No. 4 Distillate Fuel Oil	100
Farm	Diesel	0
	Other Distillate Fuel Oil	100
Off-Highway (Construction and Other)	Distillate Fuel Oil	5
Oil Company	Distillate Fuel Oil	50

<sup>a</sup> This value differs from the 0% assumption adopted in EPA's nonroad diesel emissions rulemaking because it is known that some diesel fuel is used by stationary sources (a 15 percent value was selected for use as an approximate mid-point of a potential range of 8 to 24% stationary source use computed from a review of national data from the EIA's *Manufacturing Energy Consumption Survey* and "Fuel Oil and Kerosene Sales").

**Table II-8. Assumptions Used to Estimate Commercial/Institutional Sector Stationary Source Distillate Fuel Consumption**

Sector	Distillate Fuel Type	% of Total Consumption from Stationary Sources
Commercial	No. 1 Distillate Fuel Oil	80
	No. 2 Distillate Fuel Oil	100
	No. 2 Distillate/Ultra-Low, Low, and High Sulfur Diesel	0 <sup>a</sup>
	No. 4 Distillate Fuel Oil	100

<sup>a</sup> A very small portion of total commercial/institutional diesel is actually consumed by point sources (SCC 203001xx).

**c. Non-Fuel Energy Consumption**

Some Industrial sector energy is consumed for non-fuel purposes. For example, natural gas is used as a feedstock in chemical manufacturing plants and to make nitrogenous fertilizer, and LPG is used to create intermediate products that are made into plastics. To estimate the volume of fuel that is associated with ICI combustion, it is necessary to subtract the volume of fuel consumption for non-energy uses from the volume of total fuel consumption. The EPA's State Inventory Tool (SIT) provides national defaults representing the percentage of total Industrial fuel consumption from non-energy uses. These default values have an additional limitation beyond their lack of geographic detail - they represent the EIA's definition of the Industrial sector, which includes fuel use that is accounted for in other inventory source categories (e.g.,

Farm, Mining, Construction, and Commercial sectors fuel use that is accounted for in the nonroad inventory). Because of these limitations, Pechan used regional non-fuel use percentages computed from energy consumption data from the EIA's 2006 *Manufacturing Energy Consumption Survey* (MECS) for all fuel types (EIA, 2009c).

There are two reasons why MECS provides a more representative data set for use in this project: (1) MECS provides data specific to the region of interest; and (2) MECS focuses solely on the Manufacturing sector. The latter characteristic is particularly important for fuel types which consume significant amounts of non-Manufacturing sector energy that is already included elsewhere (e.g., distillate fuel used by the Construction sector, which is included in the nonroad inventory). The MECS non-fuel consumption data treat coal that is used to produce coke as a feedstock (Lorenz, 2009). However, available data indicate that only four of the SESARM states produce coke (Alabama, Kentucky, Virginia, West Virginia; EIA, 2008a) and coke combustion is not included in the area source emissions inventory. Because of this, Pechan estimated the percent energy consumption from non-fuel use for SESARM states without coke plants by subtracting the coal used in the primary metals industrial subsector (NAICS code 331\*) from the MECS coal dataset. More than 97 percent of coking coal is ultimately consumed in this subsector (Lorenz, 2009). Table II-9 presents the non-fuel use percentages by type of energy.

**Table II-9. Industrial Sector Energy Consumption from Non-Fuel Uses**

Energy Type	2006 MECS % Energy Consumption from Non-Fuel Use	
	South <sup>1</sup>	National
Residual	30%	20%
Distillate	12%	12%
Natural Gas	11%	7%
LPG/NGL	99%	97%
Coal (excludes coking coal)	9%	6%

Sources: EIA, 2009c and Lorenz, 2009.

<sup>1</sup> All SESARM states are in the South region.

#### **d. Emission Factors**

Table II-10 presents the criteria pollutant emission factors that Pechan used in calculating ICI combustion area source emissions. Except as noted below, all criteria air pollutant emission factors are from an EPA database used to prepare the 2008 nonpoint source NEI (Huntley, 2009).<sup>7</sup> Wood combustion emission factors are from *AP-42* (EPA, 2003b). Because there are no NH<sub>3</sub> emission factors for ICI fuel combustion available in the 2008 NEI emission factor database, *AP-42*, or EPA's WebFIRE, Pechan used emission factors reported in an NH<sub>3</sub> emissions Emission Inventory Improvement Program (EIIP) guidance document (Pechan, 2004).

<sup>7</sup> All criteria pollutant emission factors were rounded to two decimal places.

Table II-10. Criteria Pollutant Emission Factors for ICI Combustion Area Source Categories

SCC	Description	Emission Factor Units <sup>1</sup>	VOC	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM2.5-FIL	PM10-FIL	PM-CON	NH <sub>3</sub>

Source: Unless otherwise noted, 2008 nonpoint source NEI (Huntley, 2009).

Notes: <sup>1</sup> lb = pound; ton = short ton; gal = gallon; MMcf = million cubic feet; MMBtu = million British thermal units; bbl = barrels; S = sulfur content; A = ash content<sup>2</sup> Emission factors from Commercial/Institutional LPG.<sup>3</sup> Emission factors from AP-42, Section 1.6, Wood Residue Combustion in Boilers (EPA, 2003b).<sup>4</sup> Emission factor from Pechan, 2004 (converted from lb/ton using 0.08 ton/MMBtu for Industrial sector and 0.0625 ton/MMBtu for Commercial sector).

With a few notable exceptions, the 2008 NEI emission factors are the same as those used for the 2002 NEI.<sup>8</sup> The PM emission factors for natural gas and LPG combustion are the major exceptions. Because the 2002 emission factors were deemed too high because of artifact formation in the test method (method 202) during stack testing, EPA developed a set of SCC-specific adjustment factors to apply to the 2002 NEI to better reflect PM emissions from these fuels.<sup>9</sup> In preparation for the 2008 NEI, EPA developed revised natural gas PM emission factors by applying these adjustment factors to the 2002 NEI emission factors. Revised emission factors for LPG were computed by applying appropriate conversion factors to the updated natural gas emission factors.

*e. Coal Sulfur and Ash Content*

For a recent ICI combustion area source inventory project for the Central Regional Air Planning Association (CENRAP), Pechan evaluated the reliability of various data sources for coal sulfur content to be used to estimate emissions in that project. Pechan evaluated five potential data sources:

1. 2002 CENRAP state point source inventories;
2. U.S. Geological Survey (USGS)'s U.S. Coal Quality Database;
3. Energy Information Administration (EIA)'s "Cost and Quality of Fuels for Electric Plants 2002 and 2003."
4. EIA's "EIA-423 - Monthly Nonutility Fuel Receipts and Fuel Quality Data, 2002;" and
5. EIA's "Quarterly Coal Report, January-March 2003."

Pechan evaluated these coal sulfur content data sources with respect to two specific criteria identified in the QAPP for this project: representativeness and accuracy. Based on these evaluations, Pechan used the average sulfur content data from EIA's "Quarterly Coal Report" to estimate the sulfur content of both Industrial and Commercial/Institutional sector bituminous/subbituminous coal in each SESARM state (EIA, 2008b). Even though this source does not report whether the coal is bituminous/subbituminous or anthracite, it is appropriate to treat the values for this source as representative of bituminous/subbituminous coal because anthracite accounts for only a very small proportion of coal consumption in SESARM states.

Due to the lack of available data for anthracite coal, Pechan used the average ash content (13.38 percent) and sulfur content (0.89 percent) from the 2002 NEI for the Industrial and Commercial/Institutional sectors. These percentages are based on the composition of anthracite coal seams in Pennsylvania, where all anthracite coal imported by SESARM states originated in 2007 (EIA, 2008c). Tables II-11 and II-12 report the coal ash and/or sulfur content values that were used in calculating ICI combustion area source emissions for the 2007 base year inventory.

---

<sup>8</sup> The 2002 NEI documentation provides citations to the AP-42 source for each emission factor.

<sup>9</sup> These factors reduce PM emissions by more than 90 percent.

**Table II-11. Bituminous/Subbituminous Coal Sulfur Content for 2007 ICI Combustion**

State	Industrial Coal <sup>1</sup> Sulfur Content (%)	Commercial/ Institutional Coal <sup>2</sup> Sulfur Content (%)
Alabama	0.94	0.94
Florida	0.87	0.87
Georgia	0.95	0.95
Kentucky	0.89	0.89
Mississippi	2.01	2.01
South Carolina	1.10	1.10
North Carolina	0.90	0.90
Tennessee	1.21	1.21
Virginia	0.96	0.96
West Virginia	0.95	0.95

<sup>1</sup>Reflects the average from coal received in 2007.

<sup>2</sup>Assumes that coal burned in the Commercial/Institutional sector has the same composition as coal burned in the Industrial sector.

**Table II-12. Anthracite Coal Ash and Sulfur Content for 2007 ICI Combustion**

West Virginia	13.38	0.89	13.38	0.89

*f. County Allocation Data*

After computing state-level area source emissions using the data described above, the next step is to allocate these emissions to individual counties. Separate allocation approaches were implemented for the Industrial and Commercial/Institutional sectors. For Commercial/Institutional sector source categories, the approach relies on county employment data compiled from government sources. For Industrial sector source categories, the approach utilizes county-level Industrial sector energy consumption estimates developed in this effort.

*Commercial/Institutional*

Because SEDS data originate from EIA fuel sector-specific surveys of energy suppliers,<sup>10</sup> Pechan reviewed these survey forms/instructions for further details on what SEDS considers Commercial sector use of each fuel. This review found that the surveys/guidance do not always provide further clarity. In addition, the EIA has admitted that energy suppliers may use their own account classifications as well as EIA guidance in determining whether a particular account belongs in the Residential, Commercial, Industrial, or Transportation sector. The only source of NAICS-code based EIA definitions of the Commercial energy sector is a “rough crosswalk” between Commercial building types and NAICS codes developed for EIA’s Commercial Building Energy Consumption Survey (CBECS). With the exception of NAICS code 814 (Private Households), this crosswalk links all NAICS codes between 42 and 92 with Commercial building energy consumption. Employment data for the CBECS-identified NAICS codes (42 through 92 with exception of 814) were used to allocate SEDS energy consumption data to individual counties. Pechan used private sector 2006 employment data from *County Business Patterns* (CBP) and public sector 2006 employment data from the *Census of Governments* (Census, 2009a; and Census, 2009b) because these data were already compiled in support of the 2008 NEI (year-to-year changes in county employment proportions are expected to be minimal).

*Industrial*

Unlike the Commercial sector, documentation provides a clear listing of the NAICS codes associated with SEDS Industrial energy consumption data: “the industrial sector encompasses the following types of activity: Manufacturing (NAICS codes 31–33); Agriculture, Forestry, Fishing and Hunting (NAICS code 11); Mining, including Oil and Gas Extraction (NAICS code 21); and Construction (NAICS code 23).” As noted earlier, a portion of Industrial sector consumption (Agriculture, Mining and Construction) is already accounted for in other emission inventory sectors and was removed. Therefore, Pechan did not expand the list of NAICS codes used to represent the area source Industrial fuel combustion category beyond the Manufacturing sector NAICS codes (31-33).

Employment-based county allocation methods lead to overrepresentation of energy consumption in counties with sectors that have high employment but low energy intensities (measured on a Btu per employee basis), and vice-versa. Given that Manufacturing sectors have much greater energy intensity variability than Commercial/Institutional sectors, Pechan utilized energy use per

<sup>10</sup> For natural gas, for example – EIA-176 “Annual Report of Natural and Supplemental Gas Supply and Disposition.”

employee values by NAICS code to improve upon the employment-based county allocation approach used in the 2008 NEI for the Industrial fuel combustion category. This procedure relied on 2007 national energy consumption data by NAICS code as reported by EIA in *Annual Energy Outlook* (EIA, 2009d). Energy intensity values were computed by dividing these Btu-based energy consumption estimates by NAICS code-level 2007 national employment data. The resulting intensity values were then multiplied by county/NAICS code-level employment estimates from CBP to estimate total county energy consumption by NAICS code. These values were then summed for the appropriate Industrial fuel combustion NAICS codes. The resulting county-level total Industrial energy consumption estimates were used to apportion state-level area source Industrial fuel combustion emissions to each county.

#### Estimation of Withheld Employment Data

Due to concerns with releasing confidential business information, the CBP withholds values for a given county/NAICS code if it would be possible to identify individual businesses from these values. In such cases, the CBP reports a letter code, representing a particular employment size range. Pechan used the following procedure to estimate data for withheld counties/NAICS codes.

1. County-level employment for counties with reported values are totaled by state for the applicable NAICS code.
2. Value from step 1 is subtracted from the state employment value for the NAICS code.
3. Each of the withheld counties is assigned an initial employment estimate reflecting the midpoint of the CBP range code (e.g., code A, which reflects 1-19 employees, is assigned an estimate of 10 employees).
4. The initial employment estimates from step 3 are then summed to the state level.
5. The value from step 2 is divided by the value from step 4 to yield an adjustment factor to apply to the initial employment estimates to yield employment values that will sum to the state employment total for the applicable NAICS code.
6. The final county-level employment values are estimated by multiplying the initial employment estimates from step 3 by the step 5 adjustment factors.

**Example: NAICS 31-33 (Manufacturing) in Maine**

fipsstate	fipscty	naics	empflag	emp
23	001	31----		6,774
23	003	31----		3,124
23	005	31----		10,333
23	007	31----		1,786
23	009	31----		1,954
23	011	31----		2,535
23	013	31----		1,418
23	015	31----	F	0
23	017	31----		2,888
23	019	31----		4,522
23	021	31----		948
23	023	31----	I	0
23	025	31----		4,322
23	027	31----		1,434
23	029	31----		1,014
23	031	31----		9,749

1. The total of employees not including counties 015 and 023 is 52,801.
2. The state-level CBP reports 59,322 employees in NAICS 31—the difference is 6,521.
3. County 015 is given a midpoint of 1,750 (since range code F is 1,000-2,499) and County 023 is given a midpoint of 17,500.
4. State total for these two counties is 19,250.
5.  $6,521/19,250 = 0.33875$ .

The final employment estimate for county 015 is  $1,750 * 0.33875 = 593$ . The county 023 final employment estimate is computed as  $17,500 * 0.33875 = 5,928$ .

**C. INVENTORY SUPPLEMENTATION/FINAL DATA MERGING**

As directed by S/L agencies, Pechan supplemented 2007 S/L agency supplied emissions data (when supplied) and Pechan default emissions data with emissions data from the 2002 nonpoint source NEI, or in the case of Georgia, the state's 2005 Consolidated Emissions Reporting Rule (CERR) submittal. To assist agencies that supplied S/L emissions data, Pechan compiled a list of SCC/pollutant combinations in the S/L area's portion of the 2002 nonpoint source NEI that did not match to combinations in either the S/L agency inventory or Pechan's default inventory. This list was documented in an Excel worksheet and transmitted along with a request for agencies to identify whether each combination's emissions should be carried forward or grown to 2007 using EGAS growth factors. Pechan contacted agencies with any necessary follow-up questions to clarify guidance on the NEI supplementation procedure.

To assist agencies that did not supply their own emissions data, Pechan compiled a list of SCC/pollutant combinations in the state's portion of the 2002 nonpoint source NEI that did not match to combinations in Pechan's default inventory. These lists were documented in an Excel workbook, which also contained a worksheet identifying associated inventory supplementation

questions (e.g., “the 2002 NEI reports VOC emissions under Dry Cleaning/Perchloroethylene SCCs—Pechan’s default inventory does not include VOC emissions for this SCC because perchloroethylene is no longer considered a VOC by EPA. Please confirm that VOC emissions from these SCCs should not be carried forward/grown”). After reviewing state agency responses to these data merging questions, Pechan contacted agencies with follow-up questions as necessary to clarify state guidance.

Table II-13 displays the SCC/pollutant combinations for which 2002 nonpoint source NEI emissions were carried forward or grown to 2007 using growth factors from EGAS.<sup>11</sup> Further documenting the data merging procedures are NIF EM table records and the SCC/county-level emission summaries that display a data source code for each record. Table II-14 presents the data source codes used to document the source of each area source emission record. The compiled inventory was converted into EPA’s NIF 3.0 nonpoint source format.<sup>12</sup>

---

<sup>11</sup> Note that for some SCCs, EGAS did not provide growth factors. In these cases, Pechan used underlying EGAS 5.0 information (i.e., the EGAS Version 5.0 SCC-to-growth indicator crosswalk and economic output data from version 5.5 of the Regional Economic Models, Inc. [REMI] model) to develop growth factors.

<sup>12</sup> Pechan removed throughput data when 2002 nonpoint source NEI data were carried forward,

<sup>1</sup> Pechan Default Inventory for GA supplemented with EGAS-grown emissions from Georgia's 2005 CERR submission.

<sup>2</sup> PM emission records for SCCs 2401055000 and 2401200000 grown from 2002 NEI using EGAS (only affects Knox County).

**Table II-14. Area Source Inventory Data Source Codes**

<b>Code</b>	<b>Description</b>
P-07-X-NPT	Pechan default area source estimate
P-07-X-PT	Pechan default total source estimate adjusted for point source activity (note that adjustment only occurred if emissions were reported in point source inventory).
N-02-G	2002 nonpoint source NEI estimate grown using EGAS
N-02-F	2002 nonpoint source NEI estimate carried forward (no growth)
S-05-G	2005 Georgia area source CERR submission estimate grown using EGAS
S-07-X	State agency-supplied estimate
L-07-X	Local agency-supplied estimate
L-07-X-VR	Estimated from local agency VOC estimate and Pechan default inventory derived ratio of pollutant emission factor to VOC emission factor.

## **D. QA/QC PROCEDURES**

In addition to the quality assurance procedures that Pechan performed on the draft 2007 stationary area source inventory (e.g., running EPA's NIF QA/Content Checker program to check for referential integrity issues, invalid entries, and out of typical range values), Pechan quality assured all updates provided by state/local agencies to ensure that they were correctly incorporated into the final inventory, and reviewed the ratios of post-point source subtraction emissions to pre-point source subtraction emissions to confirm that these subtractions were properly implemented.<sup>13</sup>

<sup>13</sup> It is important to note that it was not possible to perform the PM<sub>10</sub>-PRI and PM<sub>2.5</sub>-PRI emissions check that was implemented on the draft area source inventory because the point source subtraction procedure does not require that the sum of PM<sub>10</sub>-FIL plus PM-CON emissions and PM<sub>2.5</sub>-FIL and PM-CON emissions equal PM<sub>10</sub>-PRI and PM<sub>2.5</sub>-PRI emissions, respectively.

### III. 2007 NONROAD MOBILE SOURCE INVENTORY

The nonroad sector is comprised of nonroad engines included in EPA's NONROAD model, as well as other engines not modeled in NONROAD, including aircraft, commercial marine vessels and locomotives. A 2007 nonroad sector inventory was developed using the following general procedures:

- NONROAD model categories were based on the National Mobile Inventory Model (NMIM2008). SESARM agencies were asked to review the latest 2007 NMIM County Database and provide revisions as needed to the NMIM inputs.
- The aircraft category was based on EPA's 2008 NEI. The 2008 estimates were backcast to 2007, and any state comments were incorporated.
- The commercial marine vessel category was based on EPA's 2008 NEI, adjusted to 2007, and supplemented with any state emissions data.
- The locomotive category was based on draft Class I and Class II/III line haul emissions, as well as draft railyard emissions developed by ERTAC. Passenger and commuter rail emissions were based on EPA's 2002 NEI. State emission estimates were also included.

A more detailed description of how 2007 emissions estimates for all nonroad categories were prepared is provided below.

#### A. NONROAD MODEL CATEGORIES

NONROAD model categories include equipment such as recreational marine and land-based vehicles, farm, construction and industrial machinery, and lawn and garden equipment. These equipment are powered by compression-ignition engines, which are typically diesel-fueled, as well as spark-ignition or gasoline-fueled engines. Compressed natural gas (CNG) and LPG engines are also included in the NONROAD model. Criteria pollutant emissions may not be reported for all SCCs for all counties in the SESARM region, and will depend on the geographic allocation methods used by the model, or state-specific allocation data.

NMIM2008 incorporates EPA's latest NONROAD model (NONROAD2008) released in April 2009, and reflects all of EPA's final nonroad standards to date. Pechan first distributed the 2007 year NMIM county-level database (NCD) to SESARM agencies for review and comment. Pechan prepared a report to accompany nonroad-related tables from the 2007 NCD providing instructions for agencies to provide any updates to these files that may represent S/L/T improvements to the NMIM/NONROAD defaults (Pechan, 2009d). A summary of the tables distributed and comments received from states is provided in Table III-1.

**Table III-1. Summary of 2007 NCD Tables and State Comments**

<b>NMIM Table</b>	<b>Description</b>	<b>Comments</b>	<b>State(s)</b>
County	County-specific variables	Revised OzoneSeasonStartMonth and OzoneSeasonEndMonth Update Barometric Pressure	AL, SC, VA  Jefferson County KY, VA
CountyYearMonthHour	Hourly temps and relative humidity by month and county	Revised temperatures and relative humidity using NCDC data and EPA-prescribed methodology	VA
CountyNRFile	External NONROAD data files	Provided updates to SEASON.DAT file  Revised Underground Mining Cty Allocation File	NC  WV
CountyYear	Additional external data files (mostly onroad related)	None	
CountyYearMonth	Maps counties to monthly fuel data	Revised county/monthly gasoline profile assignments	GA, KY, Jefferson County KY, NC, SC, Davidson County TN, VA
Gasoline	Gasoline fuel properties	Revised/added gasoline fuel profiles	GA, KY, Jefferson County KY, NC, SC, Davidson Cty TN, VA
Diesel	Diesel sulfur content	Revised Diesel sulfur content	Davidson County, TN
Natural Gas	Natural gas content	None	

Further descriptions of the state data provided and how they were evaluated and used is provided below.

#### *CountyYearMonthHour Table*

Virginia provided revised temperatures and relative humidity using National Climatic Data Center (NCDC) data and the EPA-prescribed methodology for stretching hourly averages to capture daily minima and maxima values.

#### *CountyNR Table*

North Carolina provided an updated SEASON.DAT file (37000.sea) that changed the seasonal profile assignment for North Carolina from the default Mid-Atlantic region to the Southeast region.

West Virginia provided an updated county allocation file for distributing activity and emissions related to underground mining equipment in their state. This revised county distribution was based on 2007 Underground Coal Production values as reported by the West Virginia's *Office of Miners' Health Safety and Training 2007 Coal Production by County*.

### *CountyYearMonth, Gasoline, and Diesel Tables*

Several states provided revised fuel profile assignments by county, as reflected in changes to the CountyYearMonth table. In many cases, this also involved the creation of new gasoline profiles in the Gasoline table. The revisions submitted primarily related to changes by month for Reid Vapor Pressure (RVP) values as well as gasoline sulfur content. Updates to the oxygenated fuel data were provided for some states as well.

Some states also revised the diesel fuel sulfur content values for 2007. For regional consistency, unless the values were based on actual testing that reflected the diesel sulfur content in use for an area, the NMIM default values of 1218 parts per million (ppm) for land-based equipment 1389 ppm for recreational marine were retained.

Once the inputs to NMIM/NONROAD were quality assured, Pechan ran NMIM to generate 2007 annual emission estimates for all SESARM states for all nonroad SCCs. Emissions from aircraft ground support equipment are now entirely addressed by the aircraft sector inventory (see discussion under Section III.B of this report). Pechan removed emission estimates from the NMIM output for the airport GSE SCCs (i.e., SCCs 2265008005, 2267008005, and 2270008005).

## **B. AIRCRAFT**

Airport-related emission estimates were developed for the following SCCs listed in Table III-2.

**Table III-2. Aircraft Source Classification Codes**

<b>Description</b>	<b>SCC</b>
Military Aircraft	2275001000
Commercial Aircraft	2275020000
General Aviation - Piston	2275050011
General Aviation - Turbine	2275050012
Air Taxi - Piston	2275060011
Air Taxi - Turbine	2275060012
Auxiliary Power Unit (APU)	2275070000
4-Stroke Gasoline GSE	2265008005
LPG GSE	2267008005
CNG GSE	2268008005
Diesel GSE	2270008005

2007 aircraft emissions were primarily based on EPA's 2008 NEI. The procedures and data for developing aircraft emissions are described in further detail in EPA's 2008 NEI documentation (EPA, 2009a).

For commercial aircraft, the emission estimation methodology relied on airport and aircraft-specific landing and take-off (LTO) data, coupled with mode and aircraft-specific emission rates

from the FAA's Emission and Dispersion Modeling System (EDMS). Emissions for ground support equipment (GSE) and auxiliary power units (APUs) associated with commercial air carriers were estimated by EDMS, using operating time defaults based on the type of service performed. LTO data for general aviation and air taxi were obtained from FAA's Terminal Area Forecasts (TAF) and 5010 Forms. This activity was assigned to jet and propeller-driven fractions, and fleet-average emission factors were then applied.

A portion of the military aircraft LTO is also reported by the FAA's TAF and incorporated into the NEI and the SEMAP inventory. Emissions for military aircraft were only available for VOC, NO<sub>x</sub>, CO, and SO<sub>2</sub>, with no PM being reported. Since development of the initial draft SEMAP inventory, EPA made additions to the 2008 military aircraft emission estimates. However, many agencies have already reviewed and provided comments on the draft inventory compiled for SESARM. We are providing an electronic file showing additional emission records calculated by EPA for military aircraft by airport for the SESARM region. These records (with a few noted exceptions) are currently not incorporated in the inventory. Pechan is requesting feedback from each agency as to whether these records should be added to their inventory, or left out since military operations may already be adequately accounted for.

The 2008 emissions and LTO data were back-cast to 2007 using approach operations by airport and aircraft type compiled from the FAA's Air Traffic Activity Data System (ATADS) (FAA, 2010). The airport-level LTOs were assigned to counties and summed for the county. For counties with aircraft emissions without a county match in ATADS, state average growth factors were calculated and applied. The county-level growth factors are not presented in this report, but could be provided to SESARM if requested. The 2007 to 2008 growth factors were developed for each of the six airport source categories. Commercial aircraft, APU, and GSE categories relied on growth factors calculated from commercial air carrier LTOs. General aviation and air taxi were grown using LTO data reported for these specific aviation categories. Military aircraft were held constant from 2008 to 2007.

State-supplied data are summarized in Table III-3. Comments from Alabama, Georgia, and Davidson County, Tennessee related to removing non-operational airports, correcting county assignments for individual airports, or updating emissions for specific commercial airports. Georgia, North Carolina, and Virginia submitted military aircraft emissions for military bases in their state. In addition, North Carolina provided emissions for military aircraft activity at commercial airports, and also provided diesel GSE emissions associated with all military aircraft. Note that for several North Carolina facilities, EPA had already reported diesel GSE emissions associated with commercial aircraft activity, so state-provided diesel GSE emissions were added to these existing EPA estimates at the SCC level.

**Table III-3. Summary of State Updates to Aircraft Category Emissions**

State/County	SCC	SCC Description	Pollutants	Comments
Alabama	2275050011	General Aviation Piston	All	Removed emissions for 1 non-operational airport; 1 airport in GA incorrectly assigned to AL county
	2275050012	General Aviation Turbine		
Georgia	2275001000	Military Aircraft	All	Updated emissions for Dobbins Air Reserve Base
	2275007000	Auxiliary Power Unit (APU)	All	Updated emissions for Dobbins Air Reserve Base
	2275050011	General Aviation Piston	All	Made revisions to county assignments for 2 airports
	2275050012	General Aviation Turbine		
North Carolina	All SCCs	See Table III-2	All	Updated emissions for Atlanta Hartsfield Airport
	2275001000	Military Aircraft	All	Added military aircraft emissions at military bases and civilian airports
Davidson County, TN	2270008005	Diesel Airport GSE		
	2275050011	General Aviation Piston	All	Removed emissions for 4 non-operational airports; reassigned 1 airport from Davidson to Rutherford County
	2275050012	General Aviation Turbine		
	2275020000	Commercial Aircraft	All	Updated emissions for Nashville International Airport
	2265008005	Gasoline Airport GSE	All	Updated emissions for Nashville International Airport
Virginia	2270008005	Diesel Airport GSE	All	Updated emissions for Nashville International Airport
	2275001000	Military Aircraft	All but PM-10 and PM-2.5	Added military aircraft emissions for 15 military bases

North Carolina and Georgia provided estimates for all needed pollutants, and Virginia provided estimates for all pollutants, with some exceptions for PM-10 and PM-2.5. Where PM-10 was provided by Virginia for two facilities, we estimated PM-2.5 using a particle size multiplier of 0.669, from Table “Military Aircraft Emission Factors” in Appendix A to EPA 2008 NEI documentation (ERG, 2009a). PM emissions for the remaining military facilities in Virginia were not estimated.

### C. COMMERCIAL MARINE VESSELS

Commercial marine vessel emissions are reported under the following SCCs:

- 2280002100 – Diesel, In Port
- 2280002200 – Diesel, Underway
- 2280003100 – Residual, In Port
- 2280003200 – Residual, Underway

For the purpose of the NEI it was assumed that Category 1 and 2 vessels typically use distillate fuels, while Category 3 vessels primarily use residual blends. Category 3 engines are defined as having displacement above 30 liters per cylinder.

2007 CMV emissions were based largely on EPA's 2008 NEI. For Category 1 and 2 engines, national diesel emissions, based on national 2008 fuel sales, were split into near-shore port and underway components. Port emissions were assigned to 150 largest ports using port traffic data per *Waterborne Commerce of the U.S.* For the county allocation procedure, EPA developed a GIS shape file library based on Bureau of Transportation data to more precisely assign port emissions to counties, and to better allocate underway emissions to line segments/counties. This represents an improvement to the spatial allocation procedure used for previous versions of the NEI.

2008 Category 3 CMV estimates were projected from a 2002 hourly modeling inventory developed by EPA's Office of Transportation and Air Quality (OTAQ), and aggregated to an annual basis for the NEI. EPA developed Category 3 inventories for a total of 117 deep sea and inland ports, accounting for 4 different types of near-port emissions, including hotelling, maneuvering, reduced-speed zone, and cruise mode. EPA spatially allocated emissions using GIS shapefiles to specify the geographic locations for each type of near port emissions. Additional details concerning the methodologies are described in EPA's 2008 NEI documentation (EPA, 2009b).

The 2008 CMV estimates were then adjusted to represent 2007. For Category 1 & 2 diesel commercial marine vessels, 2007 emissions were estimated by applying growth factors to the 2008 emissions. National 2007 and 2008 emissions, by pollutant, were used to estimate the growth factors (EPA, 2008a). Emissions were adjusted at a national level because the surrogate data used to estimate county-level emissions for the 2008 NEI actually represent year 2007. Table III-4 shows the growth factors, by pollutant. The PM10-PRI and PM25-PRI growth factor value was also used for NH<sub>3</sub>.

**Table III-4. Category 1 & CMV Growth Factors, by Pollutant**

Pollutant	Growth Factor
CO	1.009
NH <sub>3</sub>	1.045
NO <sub>x</sub>	1.016
PM10-PRI	1.045
PM25-PRI	1.045
SO <sub>2</sub>	1.110
VOC	1.008

To estimate 2007 emissions for Category 3 residual commercial marine vessels, an annual average regional growth rate was applied as a corresponding decrease to the 2008 NEI emissions (EPA, 2008b). A correspondence was developed between the SESARM states and available regional growth rates for the East Coast and Gulf Coast. Table III-5 contains this correspondence along with the growth factor. Counties in the state of Florida were assigned to the two regions as appropriate.

**Table III-5. Category 3 CMV Growth Factors, by State and SCC**

FIPSST	State	SCC	Region	GF
01	AL	2280003100	Gulf Coast	0.955
01	AL	2280003200	Gulf Coast	0.955
12	FL	2280003100	Gulf Coast	0.955
12	FL	2280003200	Gulf Coast	0.955
12	FL	2280003100	East Coast	0.971
12	FL	2280003200	East Coast	0.971
13	GA	2280003100	East Coast	0.971
13	GA	2280003200	East Coast	0.971
21	KY	2280003100	East Coast	0.971
21	KY	2280003200	East Coast	0.971
28	MS	2280003100	Gulf Coast	0.955
28	MS	2280003200	Gulf Coast	0.955
37	NC	2280003100	East Coast	0.971
37	NC	2280003200	East Coast	0.971
45	SC	2280003100	East Coast	0.971
45	SC	2280003200	East Coast	0.971
47	TN	2280003100	East Coast	0.971
47	TN	2280003200	East Coast	0.971
51	VA	2280003100	East Coast	0.971
51	VA	2280003200	East Coast	0.971
54	WV	2280003100	East Coast	0.971
54	WV	2280003200	East Coast	0.971

State provided data are listed in Table III-6. South Carolina provided a county-level inventory for the port of Charleston for 2005. The 2005 estimates were grown to 2007 using Army Corps of Engineers data on total commodity tonnage handled at the Port of Charleston (ACE, 2010). Davidson County provided a county-level CMV inventory reported under the general SCC 2280000000. Finally, Virginia also provided a military marine emissions inventory, with the exclusion of Coast Guard Vessels, since activity for these ships should be captured by EPA's Category 1 & 2 inventory. The port and underway components of Virginia's marine inventory were assigned to the Residual, In Port and Residual, Underway SCCs, respectively. In counties where EPA had already reported residual port or underway emissions, state-provided military marine emissions were added to these existing EPA estimates at the SCC level. Any necessary pollutant augmentation is described in Table III-6.

Table III-6. Summary of State Updates to Commercial Marine Category Emissions

State/County	SCC	SCC Description	Pollutants	Comments	Additional Revisions
Charleston County, SC	2280002100	Category 1&2 Residual Port	All but NH <sub>3</sub>	Removed NEI emissions and added SC supplied emissions for Charleston County, SC.	NH <sub>3</sub> estimated using PM-10 multiplier of 0.00477 (ERG, 2009b)
	2280002200	Category 1&2 Residual Underway	All but NH <sub>3</sub>		NH <sub>3</sub> estimated using the ratio of 2008 NEI NH <sub>3</sub> /PM-10 emissions for the particular County/SCC.
	2280003100	Category 3 Diesel Port	All but NH <sub>3</sub>		NH <sub>3</sub> estimated using PM-10 multiplier of 0.00477 (ERG, 2009b)
	2280003200	Category 3 Diesel Underway	All but NH <sub>3</sub>		NH <sub>3</sub> estimated using the ratio of 2008 NEI NH <sub>3</sub> /PM-10 emissions for the particular County/SCC.
Davidson County, TN	2280000000	All Commercial Marine	All but PM-10, PM-25 and NH <sub>3</sub>	Removed all CMV NEI emissions for Davidson County, TN and added emissions supplied by the county.	PM-10 estimated using emission factor (EPA, 2008a) and fuel consumption (provided by Davidson County, TN).  PM-25 estimated using PM-10 multiplier of 0.92 (EPA, 2008a).  NH <sub>3</sub> estimated using PM-10 multiplier of 0.00477 (ERG, 2009b)
Shelby County, TN	2280002100	Category 1&2 Residual Port	All	Replaced CMV NEI emissions for Shelby County, TN with emissions supplied by the county.	
	2280002200	Category 1&2 Residual Underway	All but NH <sub>3</sub>		Relied on EPA NEI NH <sub>3</sub> emissions
Virginia	2280003100	Category 3 Diesel Port	All but VOC, PM-25, and NH <sub>3</sub>	Added military marine emissions	VOC estimated using HC multiplier of 1.053 (EPA, 2008a).  PM-25 estimated using PM-10 multiplier of 0.92 (EPA, 2008a).  NH <sub>3</sub> estimated using ratio of 2008 NEI NH <sub>3</sub> /PM-10 emissions for the particular County/SCC.
	2280003200	Category 3 Diesel Underway	All but VOC, PM-25, and NH <sub>3</sub>		VOC estimated using HC multiplier of 1.053 (EPA, 2008a).  PM-25 estimated using PM-10 multiplier of 0.92 (EPA, 2008a).  NH <sub>3</sub> estimated using ratio of 2008 NEI NH <sub>3</sub> /PM-10 emissions for the particular County/SCC.

## D. LOCOMOTIVES

Locomotive emissions are reported under the following SCCs:

- 2285002006 – Diesel Class I Line Haul
- 2285002007 – Diesel Class II/III Line Haul
- 2285002008 – Diesel Passenger (Amtrak)
- 2285002009 – Diesel Commuter
- 2285002010 – Diesel Switchyard Locomotives

Class I line haul operations typically account for the majority of fuel consumed and emissions when preparing locomotive inventories. As such, resources should be focused on developing emission estimates for these operations relative to other rail-related operations. However, for some local areas, certain operations related to switchyard activity may also be important.

For Class I line-haul locomotives, emissions are normally calculated by multiplying the amount of fuel consumed in the inventory area by pollutant-specific emission factors. This calculation is performed for each railroad. The results for each railroad are then summed to obtain the total Class I railroad emissions in the inventory area.

For Class I line haul, Pechan obtained 2007 emission estimates from the Eastern Regional Technical Advisory Committee (ERTAC, 2010a). ERTAC used the Federal Railroad Administration's GIS data to construct a dataset of link-level million gross tons per mile (MGT). Next the Railroad Fuel Consumption Index (RFCI) value was calculated for each railroad, which represents the number of GTM produced per gallon of diesel fuel. When applied to each link's GTM per year, link-based fuel consumption can be calculated. This methodology allows for a more accurate reflection of how GTM are actually concentrated across rail line route miles. Finally, the fuel consumed is multiplied by the various emission factors derived for each Class I rail line to determine link-level emissions for each pollutant. An important aspect is determining the fraction of locomotives that fall under each regulatory "Tier," since each Tier has an increasingly stringent emission rate for pollutants of concern.

A limitations of the link-level MGT data maintained by the FRA is that the data are proprietary and can only be publicly released with the express permission of each Class I railroad. In addition, when the FRA coded the link-level MGT data they did not provide a means for separating out individual MGT contributions for links that are operated by multiple railroad companies. As such, some assumptions were made for these contributions by ERTAC.

Class II/III line haul emissions were also developed and distributed by ERTAC (ERTAC, 2010b). Limited documentation has been developed to describe the procedures used by ERTAC to develop this inventory. Generally, fuel consumption for all Class II/III railroads was obtained from the American Shortline and Regional Railroad Association and assigned to counties using route miles by rail line within each county. An average fuel use factor expressed in gallons per mile was then multiplied by the route miles to estimate fuel consumption by railroad and by county. Class II/III locomotives were all assumed to be uncontrolled with respect to emission rates used for estimating pollutant emissions. Class II/III rail emissions represent calendar year

2008, and as such were back-cast to 2007 using a surrogate growth indicator. A SESARM regional growth factor of 1.438 was developed using 2007 and 2008 total distillate fuel sales/deliveries to railroad consumers which were obtained from the DOE Energy Information Administration State Energy Data (DOE, 2009a).

Passenger and commuter rail line emissions from EPA's 2002 NEI were grown to 2007. For both categories, the growth factor was developed using 2002 and 2007 passenger/commuter fuel use data obtained from the DOE Transportation Energy Data Book (DOE, 2009b). For passenger rail operations, the growth factor value was 0.732. For commuter rail operations, a growth factor of 1.11 was used.

Finally, the draft switchyard inventory was completed by ERTAC on June 4, 2010 (ERTAC, 2010c). This inventory was compiled at a railyard level by ERTAC, but was summed to a county level for use in the SEMAP 2007 inventory. Documentation describing the specific procedures used is not available to date. We are providing an electronic file that provides 2007 emissions at a railyard level, so that SESARM agencies can review the data that form the basis of the county-level estimates, and make revisions at that level as needed.

Some state data were provided for the locomotive category. These data are summarized in Table III-7. North Carolina provided a statewide passenger rail inventory for 2007. Davidson County provided a county level inventory comprised of Class I line haul and switchyard activity, reported under the general SCC 2285000000. Shelby County provided an updated Class I line haul, passenger, and yard locomotive inventory for most pollutants. Any needed pollutant augmentation is described in Table III-7.

## **E. QA/QC PROCEDURES**

Pechan performed the following quality assurance procedures on the final 2007 nonroad sector inventory.

For the NONROAD/NMIM categories, Pechan quality assured all NCD updates provided by states to ensure consistency with the NCD formats, and for reasonableness. Where questions came up, we coordinated with the appropriate state/local agency. Cross-checks were performed to confirm that state-supplied revisions were correctly incorporated into the NCD. Pechan compared results with 2007 emission estimates prepared by EPA using a prior version of the NCD. These comparisons were performed to ensure that results changed as expected given the updates made by specific states to the NMIM inputs.

Table III-7. Summary of State Updates to Locomotive Category Emissions

State	SCC	SCC Description	Pollutants	Comments	Additional Revisions
North Carolina	2285002008	Line Haul Locomotives: Passenger Trains (Amtrak)	All but NH <sub>3</sub>	Replaced NEI passenger emissions with NC supplied emissions	NH <sub>3</sub> estimated using the ratio of 2008 NEI NH <sub>3</sub> /PM-25 emissions for the particular County/SCC.
	2285002007	Line Haul Locomotives: Class I/II/III Locomotives	All	Removed activity/emissions for several rail lines	
	2285000000	All Railroad All Fuels	All but PM-25 and NH <sub>3</sub>	Replaced ERTAC rail emissions with Davidson County supplied emissions	PM-25 estimated using PM-10 multiplier of 0.97 (EPA, 2008a).  NH <sub>3</sub> estimated using ratio of 2008 NEI NH <sub>3</sub> /PM-25 emissions for the particular County/SCC.
Shelby County, TN	2285002006	Line Haul Locomotives: Class I Operations	All but NH <sub>3</sub> , PM-25, and SO <sub>2</sub>	Replaced ERTAC rail emissions with Shelby County supplied emissions	Relied on ERTAC emissions for missing pollutants
	2285002008	Line Haul Locomotives: Passenger Trains (Amtrak)			
	2285002010	Yard Locomotives			

Pechan compiled records for the SESARM region from EPA's NEI for aircraft, CMV, and passenger/commuter rail, and obtained Class I and Class II/III line haul, and railyard emission estimates from ERTAC. Pechan performed and quality assured any needed adjustments to year 2007 (i.e., correct application of growth or backcast factors). Cross-checks were also performed to verify that state-supplied emission estimates were correctly incorporated into the draft inventory. Pechan also calculated missing pollutants for SCC-level state emission estimates, where emission factors or emission ratios were available.

Emission estimates were converted into EPA's NIF3.0 as a final deliverable. For the NMIM categories, commercial marine, and locomotive, separate database files were prepared for each subsector following EPA's NIF3.0 nonpoint format. Aircraft emission estimates were prepared in EPA's NIF3.0 point source format. EPA's NIF QA Checker program was then run on these final files, and any referential integrity issues and invalid codes were identified and corrected. Finally, data source codes as described in Table III-8 were added to the NIF3.0 files to represent the source of the SCC, county-level emissions data for the final inventory.

**Table III-8. Data Source Codes Used for Final 2007  
Nonroad Mobile Emission Estimates**

<b>Code</b>	<b>Description</b>
P-07-X	Pechan default
N-02-G	2002 NEI grown
S-07-X	State supplied
S-07-X-PS	State supplied added to Pechan default
S-05-G	State supplied 2005 grown
L-07-X	Local agency supplied

## IV. EMISSIONS SUMMARIES

This section presents the emission summaries for the final 2007 stationary area and nonroad mobile emissions inventory for the SEMAP project. In addition to the summaries provided in this section, Pechan has also provided SESARM with detailed county-level emission summaries in Excel worksheets.

### A. STATIONARY AREA SOURCE EMISSIONS

Table IV-1 provides a summary of the final 2007 SESARM area source emissions inventory by the four major area source subsectors. Table IV-2 displays final area source emission estimates by state, as well as the percent contribution of each state to total regional emissions. Similar summaries providing 2007 annual state-level emission estimates for each major area source sector, as well as percent contributions by state, are shown in Tables IV-3 through IV-6.

## B. NONROAD MOBILE SOURCE EMISSIONS

Table IV-7 provides a summary of final 2007 nonroad mobile annual emissions by the four major nonroad subsectors for the SESARM region. PM-10 and PM-2.5 emissions represent primary PM, and are reported as PM10-PRI, and PM25-PRI. The commercial marine category is the most significant contributor regionally to SO<sub>2</sub> emissions. Nonroad model categories account for the large majority of emissions for NO<sub>x</sub>, VOC, PM10-PRI, PM25-PRI, and CO.

Table IV-8 presents a summary of the final annual NONROAD model emission estimates by state, as well as the percent contribution of each state to total regional emissions. Similar summaries providing 2007 annual state-level emission estimates for aircraft, commercial marine, and locomotives, as well as the percent contributions, are shown in Tables IV-9, IV-10, and IV-11, respectively.

Since development of the draft inventory, locomotive switchyard emissions developed by ERTAC have been added. These emission estimates were developed at a railyard level, and summed to the county level for the 2007 SEMAP inventory. As mentioned in Section III.D, we

are providing an electronic file that provides emissions at a railyard level, so that SESARM agencies can review the data that form the basis of the county-level estimates, and make any needed revisions. In addition, for the aircraft category, EPA made some additions to the 2008 military aircraft NEI that formed the basis of the initial draft SEMAP inventory. As discussed in Section III.B, we are distributing an electronic file showing additional emission records calculated by EPA for military aircraft by airport for the SESARM region. Agencies should provide feedback as to whether these records should be added to their inventory.

## APPENDIX A. POINT SOURCE SUBTRACTION PROCEDURE DETAILS

This Appendix describes source category-specific details on the point source subtraction procedures, and displays the area SCC to point SCC crosswalk (see Tables A-1 through A-8).

### A. ICI FUEL COMBUSTION

To assist in the point source subtractions for industrial, commercial, and institutional (ICI) fuel combustion, Pechan developed two crosswalks: one between each Industrial fuel combustion area SCC and associated point SCCs (Table A-1), and an analogous crosswalk developed for Commercial/Institutional fuel combustion (Table A-2).

Because natural gas consumed as pipeline fuel is not included by the Energy Information Administration (EIA) in EIA's state energy consumption data for the Industrial sector, it was necessary to exclude pipeline natural gas combustion emissions from the point source subtraction procedure. Since there are no SCCs specific to pipeline natural gas combustion, point source pipeline natural gas combustion emission estimates were compiled by summing emissions for industrial sector natural gas internal combustion engine records (SCC 202002xx) with a pipeline-related Standard Industrial Classification (SIC) or North American Industrial Classification System (NAICS) code (SIC codes 1311, 1321, 1381, 4612, 4613, 4619, 4922, 4923, 4924, 4925, or 4931; NAICS codes 211111, 21112, 22121, 221210, 486110, 48621, 486210, 486910, 48699, or 486990).

### B. CONSTRUCTION DUST

Table A-3 displays the point SCCs associated with dust from Construction activities. These SCCs do not provide information to separate activity into the two area source category processes:

- 2311010000 - Construction: SIC 15-17; Residential; Total; and
- 2311020000 - Construction: SIC 15-18; Industrial/Commercial/Institutional; Total.

Pechan apportioned point source construction dust emissions between the two categories using state-level acreage data reported in the EPA October 2008 report "Economic Analysis of Final Effluent Limitation Guidelines and Standards for the Construction and Development Industry" (EPA, 2009a). These proportions for each SESARM state are displayed below.

### Percentage of Construction Acreage by State and Type of Construction

State	Residential %	Other %
Alabama	36	64
Florida	41	59
Georgia	39	61
Kentucky	31	69
Mississippi	24	76
North Carolina	48	52
South Carolina	42	58
Tennessee	35	65
Virginia	45	55
West Virginia	40	60

Source: Table 4-8 from EPA, 2009a.

### C. SOLVENT UTILIZATION

Table A-5 presents the point source crosswalk for each solvent utilization nonpoint SCC. This crosswalk was derived from the crosswalk used in performing VOC emissions-based point source subtractions for the 2002 NEI. As noted in the Table A-5 crosswalk, two area source solvent utilization SCCs (2401005000-Auto Refinishing and 2401070000-Motor Vehicles) are associated with the same point SCCs. For the Auto Refinishing area source category, point source subtractions for the listed SCCs were limited to records identified with Auto Refinishing industry sector SIC/NAICS codes (e.g., NAICS code 8111\*). Emissions for all other applicable point SCC state/local inventory records were subtracted from total emissions for the Motor Vehicles source category.

### D. GASOLINE DISTRIBUTION

Table A-6 displays the point SCCs associated with gasoline distribution. Some of these SCCs do not provide information to separate activity into each area source stage I gasoline distribution filling technology. Therefore, Pechan allocated the emissions from these point SCCs to each filling technology based on the proportion of emissions from Pechan's default inventory.

Table A-1. Industrial Fuel Combustion Crosswalk for Point Source Subtractions.

Point SOC	SCC1 DESC	SCC3 DESC	SCC6 DESC	SCC8 DESC	Comments
