

Climate change: what we know (what we don't know) & why it matters

Walt Robinson, PhD: Interim Director, NC State Climate Office

Annual J-D 2009-2018 L-OTI(°C) Anomaly vs 1961-1990 0.65

<https://data.giss.nasa.gov/gistemp/>

Annual Erosion and Sediment Control Local Programs Workshop
Wake Forest – April 23, 2019

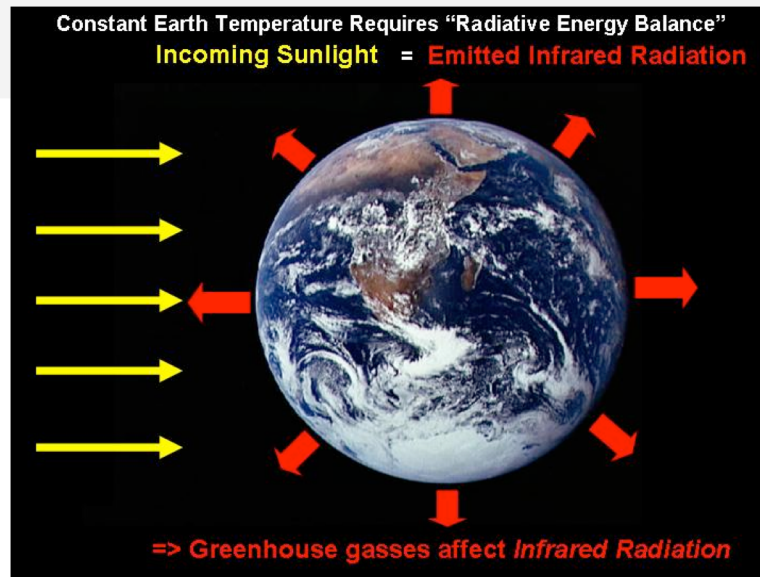

What *do* we know?

- What controls the temperature of any planet
 - the role of the “greenhouse effect”
- We are adding heat-trapping gases to Earth’s atmosphere
- Earth is warming as expected
- Warming will continue for foreseeable future
- Heavier flooding rains expected
 - Happening *now* in extreme events

Earth energy balance

- Earth: warmed by the sun, cooled by the infrared light it gives off
- Heat-trapping gases (water vapor, carbon dioxide, ...) partially block outgoing infrared light, warming Earth

The greenhouse effect is good!

- Without it Earth would be too cold for most life

No heat trapping gases: T below 0°F

Natural heat trapping gases: T ~ 56 °F

Global warming comes from *added* heat-trapping gases

- CO₂ up nearly 50% since 1800
 - Burning coal, oil , & gas; clearing forests & prairies
- Double CO₂: expect 3 - 8 °F warming
 - Svante Arrhenius: 1896
 - *Not a new idea*
at current pace, CO₂ will double its preindustrial level in ~50 years

<https://www.esrl.noaa.gov/gmd/ccgg/trends/full.h>

Earth has warmed as expected

- About 1.8 °F (1 °C) since 1900

What about NC?

- Muted warming so far (first half of the 20th Century was warm in NC)

Observed and Projected Temperature Change

<https://statesummaries.ncics.org/>

Nighttime lows have warmed most

- Enhanced greenhouse limits overnight cooling

Observed Average Daily Minimum Temperature – Annual

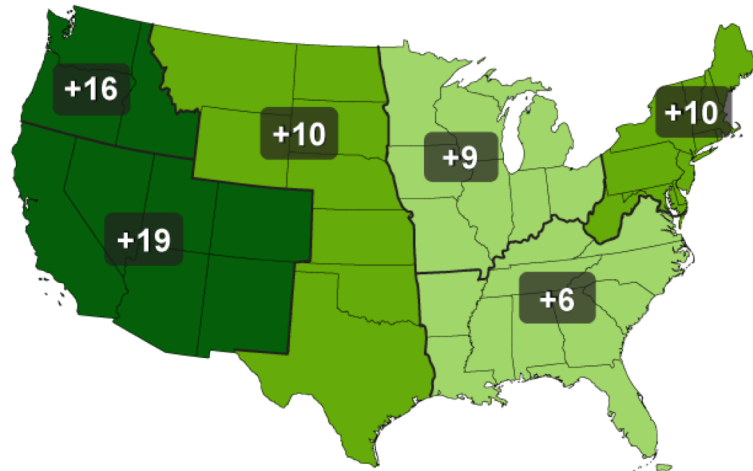

<https://statesummaries.ncics.org/>

Longer frost-free season

- 1991-2012 compared to 1901-1960
Temperature above 32 °F

Observed Increase in Frost-Free Season Length

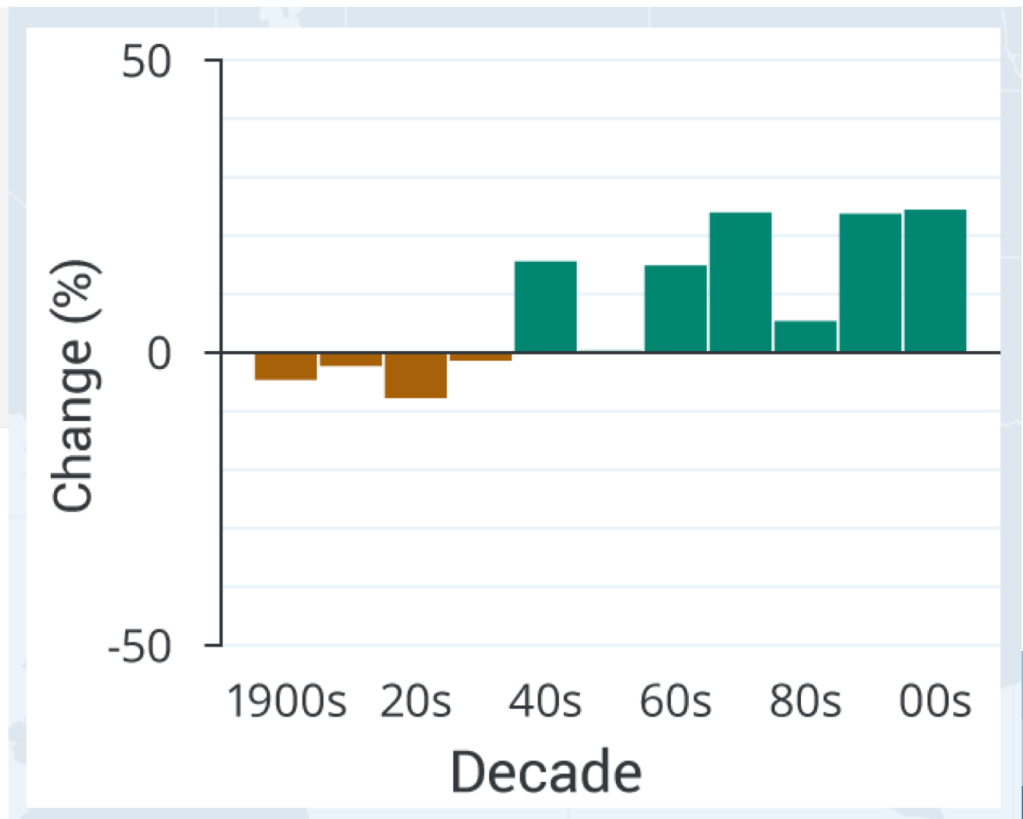

Change in Annual Number of Days

<https://nca2014.globalchange.gov/>

More intense rain

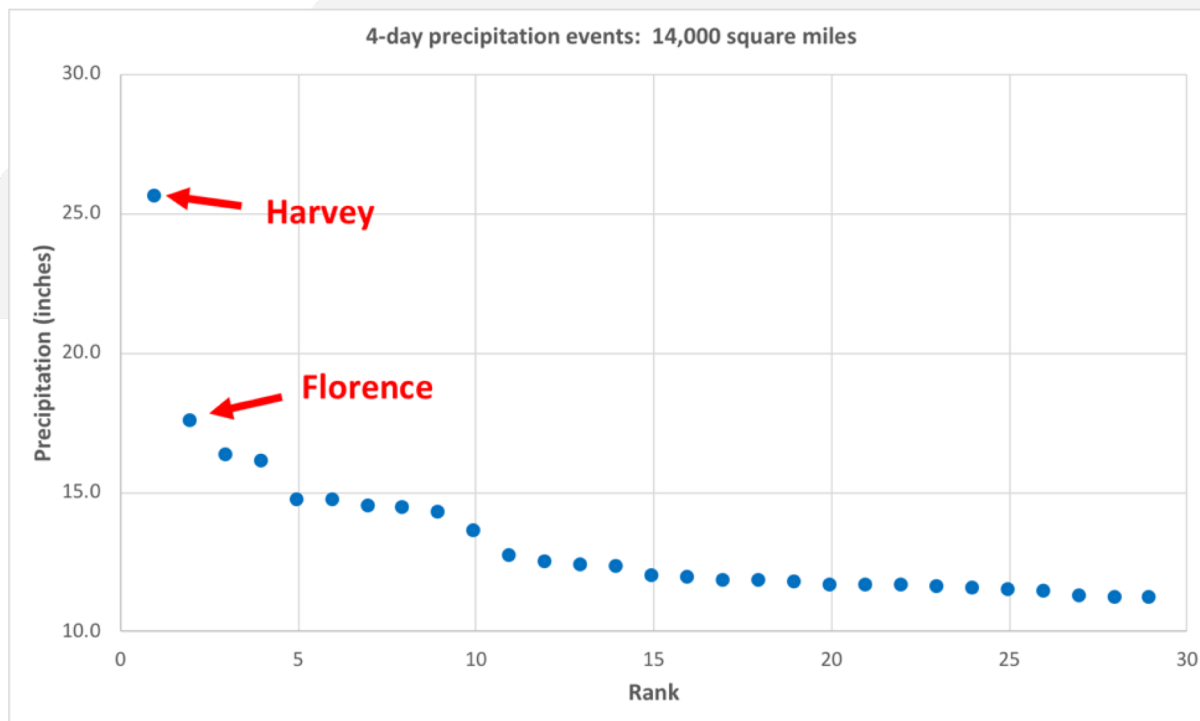

- A warmer atmosphere “holds” more water vapor
 - 4% more for each 1 °F warming

<https://nca2014.globalchange.gov/>

Increasing rain from hurricanes

- Biggest US storms in *volume* of rain since 1949:
 - #1: Harvey in 2017
 - #2: Florence in 2018

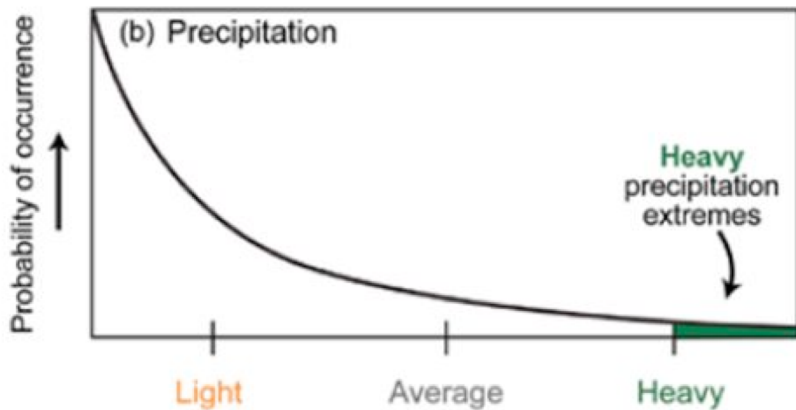

Ken Kunkel
NC State/NCICS

<https://ncics.org/cics-news/putting-hurricane-florence-into-historical-perspective/>

Changes in extremes appear first

- Small changes => big changes in frequency of extremes

What Is an Extreme?

Increase in Probability of Extremes in a Warmer Climate

© Crown copyright

Projecting future storms

- Hard! Climate models don't resolve storms
- Simulate storms in storm-scale models in current & future climate conditions
 - Get future climate from climate model
- Example: July 2016 Raleigh rain storm
 - Unexceptional summer storm (“weakly forced”)
 - \$400k damage, nuisance flooding, water rescues

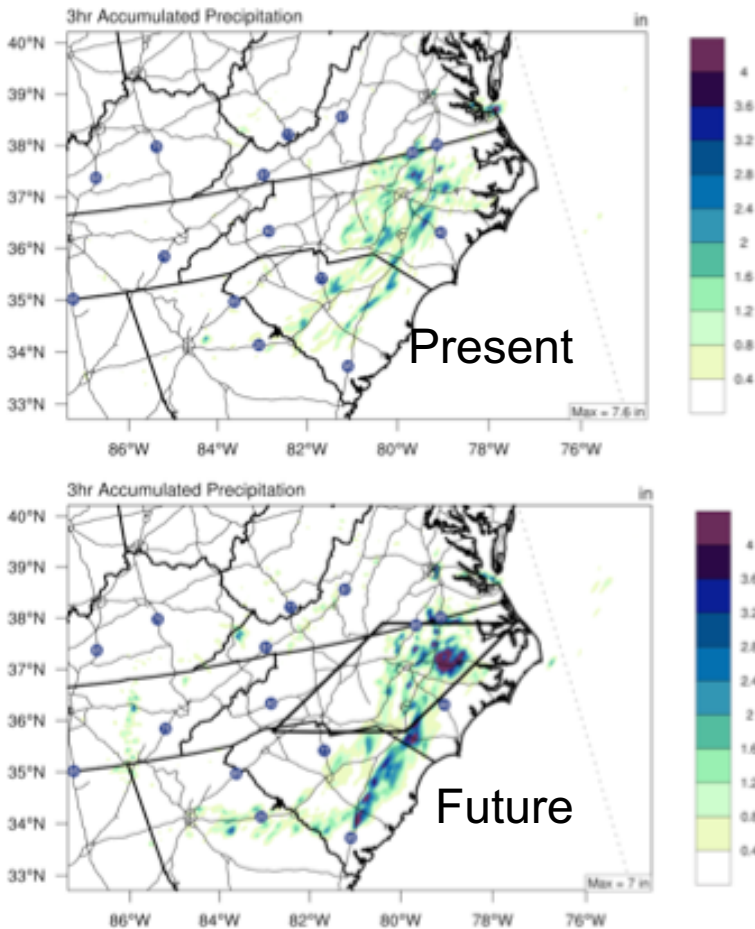

Flooded garage at Crabtree

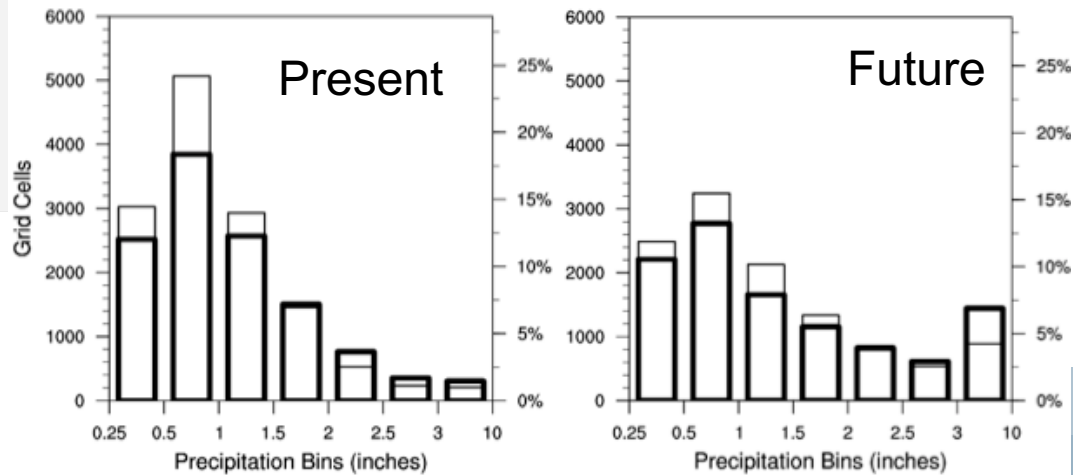

Raleigh July 2016 flood *simulated:* now & in the future

Rainfall (3 hr at peak)

- WRF model – 4 km grid
- Climate change in 2090s – from IPCC GCMs
- Future runs show *large* increases in heaviest rain

Accumulated rainfall distribution

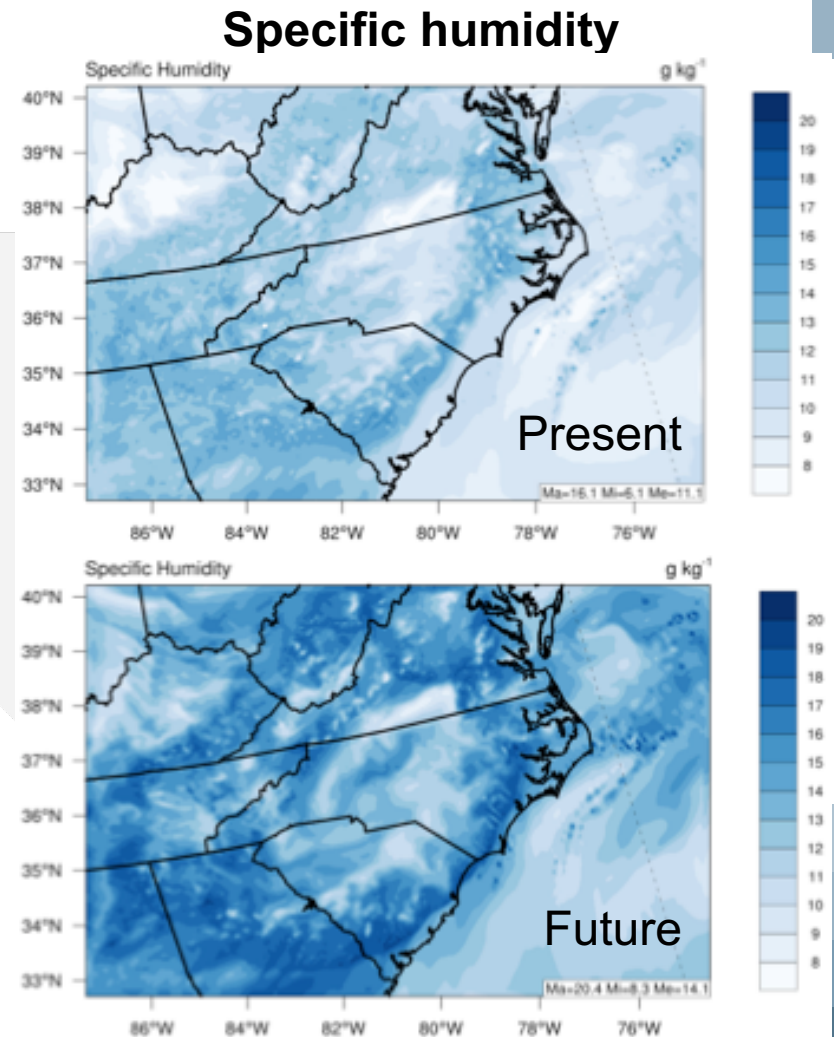

PhD work of J. Mike Madden

Uncertainties

- Method assumes future large-scale weather systems won't change
 - Conservative assumption, but probably wrong
- Even high-resolution models of storms are imperfect
 - many processes *parameterized*
- More moisture => more rain is reliable; changes that depend on detailed storm dynamics are not

What *do* we know?

- Warmer
- Heaviest rains will be heavier

What *don't* we know?

- How much warmer (globally & regionally)
- How much heavier rains
- Changes in regional storm occurrence (e.g. hurricanes)
- Changes in drought frequency

IPCC's view

Phenomenon and direction of trend	Assessment that changes occurred (typically since 1950 unless otherwise indicated)	Assessment of a human contribution to observed changes	Likelihood of further changes	
			Early 21st century	Late 21st century
Warmer and/or fewer cold days and nights over most land areas	<i>Very likely</i> {2.6}	<i>Very likely</i> {10.6}	<i>Likely</i> {11.3}	<i>Virtually certain</i> {12.4}
	<i>Very likely</i> <i>Very likely</i>	<i>Likely</i> <i>Likely</i>		<i>Virtually certain</i> <i>Virtually certain</i>
Warmer and/or more frequent hot days and nights over most land areas	<i>Very likely</i> {2.6}	<i>Very likely</i> {10.6}	<i>Likely</i> {11.3}	<i>Virtually certain</i> {12.4}
	<i>Very likely</i> <i>Very likely</i>	<i>Likely</i> <i>Likely (nights only)</i>		<i>Virtually certain</i> <i>Virtually certain</i>
Warm spells/heat waves. Frequency and/or duration increases over most land areas	<i>Medium confidence</i> on a global scale <i>Likely</i> in large parts of Europe, Asia and Australia {2.6}	<i>Likely</i> ^a {10.6}	Not formally assessed ^b {11.3}	<i>Very likely</i> {12.4}
	<i>Medium confidence</i> in many (but not all) regions <i>Likely</i>	Not formally assessed <i>More likely than not</i>		<i>Very likely</i> <i>Very likely</i>
Heavy precipitation events. Increase in the frequency, intensity, and/or amount of heavy precipitation	<i>Likely</i> more land areas with increases than decreases ^c {2.6}	<i>Medium confidence</i> {7.6, 10.6}	<i>Likely</i> over many land areas {11.3}	<i>Very likely</i> over most of the mid-latitude land masses and over wet tropical regions {12.4}
	<i>Likely</i> more land areas with increases than decreases <i>Likely over most land areas</i>	<i>Medium confidence</i> <i>More likely than not</i>		<i>Likely</i> over many areas <i>Very likely over most land areas</i>
Increases in intensity and/or duration of drought	<i>Low confidence</i> on a global scale <i>Likely</i> changes in some regions ^d {2.6}	<i>Low confidence</i> {10.6}	<i>Low confidence</i> ^g {11.3}	<i>Likely (medium confidence)</i> on a regional to global scale ^h {12.4}
	<i>Medium confidence</i> in some regions <i>Likely</i> in many regions, since 1970 ^e	<i>Medium confidence</i> ^f <i>More likely than not</i>		<i>Medium confidence</i> in some regions <i>Likely</i> ^e
Increases in intense tropical cyclone activity	<i>Low confidence</i> in long term (centennial) changes <i>Virtually certain</i> in North Atlantic since 1970 {2.6}	<i>Low confidence</i> ⁱ {10.6}	<i>Low confidence</i> {11.3}	<i>More likely than not</i> in the Western North Pacific and North Atlantic ^j {14.6}
	<i>Low confidence</i> <i>Likely</i> in some regions, since 1970	<i>Low confidence</i> <i>More likely than not</i>		<i>More likely than not</i> in some basins <i>Likely</i>
Increased incidence and/or magnitude of extreme high sea level	<i>Likely</i> (since 1970) {3.7}	<i>Likely</i> ^k {3.7}	<i>Likely</i> ^l {13.7}	<i>Very likely</i> ^l {13.7}
	<i>Likely</i> (late 20th century) <i>Likely</i>	<i>Likely</i> ^k <i>More likely than not</i> ^k		<i>Very likely</i> ^m <i>Likely</i>

Why don't we know?

- *Human behavior*: future emissions?
- *Computing power*: global models don't resolve key processes that matter for storms & other extreme events
 - Compute time scales like model resolution cubed
- *Science*: imperfect understanding of weather/climate processes

<https://www.ipcc.ch/report/ar5/wg1/>

Reducing emissions reduces risks

- *Big* reductions in US projected costs from lower emissions

<https://nca2018.globalchange.gov/>

Annual Economic Damages in 2090		
Sector	Annual damages under RCP8.5	Damages avoided under RCP4.5
Labor	\$155B	48%
Extreme Temperature Mortality ϕ	\$141B	58%
Coastal Property ϕ	\$118B	22%
Air Quality	\$26B	31%
Roads ϕ	\$20B	59%
Electricity Supply and Demand	\$9B	63%
Inland Flooding	\$8B	47%
Urban Drainage	\$6B	26%
Rail ϕ	\$6B	36%
Water Quality	\$5B	35%
Coral Reefs	\$4B	12%
West Nile Virus	\$3B	47%
Freshwater Fish	\$3B	44%
Winter Recreation	\$2B	107%
Bridges	\$1B	48%
Munic. and Industrial Water Supply	\$316M	33%
Harmful Algal Blooms	\$199M	45%
Alaska Infrastructure ϕ	\$174M	53%
Shellfish*	\$23M	57%
Agriculture*	\$12M	11%
Aeroallergens*	\$1M	57%
Wildfire	-\$106M	-134%

Take-aways

- Warming & heavier rains are highly confident projections
 - From basic physics – don't depend on complex models
- Plan for more intense rain events
 - Happening now
 - Don't wait for numbers – reliable ones are not coming soon
- *Any* reduction in emissions of heat-trapping gasses is an unalloyed good, lessening the risk of bad outcomes

Hurricane Florence flooding in Lumberton
