GEOLOGICAL SURVEY SECTION

The Geological Survey Section examines, surveys and maps the geology, mineral resources, and topography of the State to encourage the wise conservation and use of these resources by industry, commerce, agriculture, and government agencies for the general welfare of the citizens of North Carolina.

The Section conducts basic and applied research projects in environmental geology, mineral resource exploration, and systematic geologic mapping. Services include identifying rock and mineral samples submitted by citizens and providing consulting services and specially prepared reports to agencies that need geological information.

The Geological Survey Section publishes Bulletins, Economic Papers, Information Circulars, Educational Series, Geologic Maps, and Special Publications. For a list of publications or more information about the Section contact the Geological Survey Section, Division of Land Resources, at Post Office Box 27687, Raleigh, North Carolina 27611-7687, or call (919) 733-2423.

A LISTING OF NORTH CAROLINA GEOLOGICAL SURVEY MICA MINE FILES AND A DISCUSSION OF THE MINERAL

INTRODUCTION

This publication contains a listing of 1,062 mica mine files that can be viewed at the North Carolina Geological Survey's Raleigh and Asheville locations. In addition, this report gives a brief description of mica, its background, uses and current and future demands by major industries.

Many of the files listed have reports and maps while others contain only a brief report. Most file information was prepared during World War II by the U.S. Department of the Interior's Geological Survey for the U.S. Department of Defense. Copies of the reports may be made at a nominal charge.

The files document on-site geological data collected when most of the mines were either in production or exploration. Most of the mines have been abandoned for 30 years or more and the workings are now poorly exposed or even inaccessible. These mines were all developed in pegmatite bodies composed mainly of feldspar, quartz, and muscovite mica. Large books of muscovite, which would yield material meeting sheet mica specifications, were the principal commodity sought at most of the mines in this listing.

Scrap mica, derived in part from mining, and in part from the trimming and processing operations, was a byproduct. Some mines also produced feldspar, and additionally quartz was extracted from several operations. Concurrent with mica mining, small quantities of columbite-tantalite, samarskite, or beryl were recovered at a few of the mines. During the 1970s, many of the same pegmatite

deposits were investigated for their potential as sources of uraninite.

Commercial mining for sheet mica started in North Carolina in 1867. At first mica was mined only in Jackson and Haywood Counties, but sometime during 1867, General Thomas L. Clingman began to explore the State's mica potential. Soon mines were opened in many counties. Mica became a booming business and was mined without interruption until 1962. And, between 1930 and 1959, North Carolina was the leading sheet mica producer in the Nation. The need for sheet mica, however, has rapidly declined since 1962, and the North Carolina sheet mica mines are no longer active. Factors that contributed to the closing of the mines are high cost of mining and foreign competition.

The demand for scrap mica — although currently depressed by low construction — remains high. North Carolina is the leading producer of scrap mica by producing more than 50 percent of the national total output. Today, most scrap mica produced in the State is recovered as a byproduct of feldspar and kaolin beneficiation. Primary sources are alaskite and pegmatite deposits in the western part of the State. Leading producers of scrap mica in the Spruce Pine area are the Unimin Corporation and DeNeen Mica Company. In the Kings Mountain area, KMG Minerals, Inc., and J. M. Huber are major producers.

Mines listed in this report are grouped by county and, within each county grouping, the mines are arranged alphabetically. The content of files is

shown in the columns labeled “No. of Maps” and “No. of Reports.” Location of files is indicated by either Raleigh or Asheville. Files that are available at both locations are listed twice, because in many instances the two files contain slightly different information. Maps showing the location of most of the mines are included in a published report (Lesure, 1968). Statistical data on mica, demand forecasts, and much of the end use and background information in this report is based on publications by the U.S. Bureau of Mines (Zlobik, 1979, 1980; Davis, 1990).

For further information, or for an appointment to examine the files, please call the North Carolina Geological Survey’s Raleigh office at (919) 733-2423; or the Asheville office at (704) 251-6208. The North Carolina Geological Survey’s Raleigh office is located at 512 North Salisbury Street, Suite 527, P. O. Box 27687, Raleigh, North Carolina 27611-7687. The North Carolina Geological Survey’s Asheville office is located on the 3rd floor of the Interchange Building at 59 Woodfin Place, Asheville, North Carolina 28801.

MICA

Mica is a group name for different minerals with similar properties. Although mica minerals vary considerably in physical and chemical properties, all mica has a common platy morphology and a perfect basal cleavage. The perfect basal cleavage allows the mineral to separate into very thin, flexible sheets. Mica has unique thermal and electrical properties and is also resistant to chemical attack.

Muscovite, phlogopite, lepidolite, and biotite are the most important micas. Muscovite, also called common mica, occurs in transparent thin sheets and thicker, translucent blocks. The color of muscovite mica is light yellow to brown, green or red. Phlogopite is yellowish brown, green, or

white; it is transparent in thin sheets and vitreous or pearly in thick blocks. Lepidolite, a rare mica mineral, has a pink to lilac to grayish white color; it is translucent with a pearly luster. The color of biotite is dark green, brown to black, or (rare) light yellow; luster is splendent, and thin sheets usually have a smoky color.

Background

It is believed that mica was first mined in India about 2000 B.C. The early Hindu writers referred to mica as “preserved flashes of lightning.” Mica was used by the ancient Indians for decoration and as a medicine. The practice of using mica as a medicine continues in some remote areas today.

Mica may have received its name from the Romans. The Latin word *micare* means to glitter and shine, and references by the Roman scholar Pliny suggest that the Romans used shiny, platy mica. Pliny mentions shiny material scattered over the Circus Maximus, and transparent stones used as window coverings.

In North America, Indians in the southern Appalachian Mountain area probably began mining for mica before the 14th century. The Indians used mica mostly for grave site ornamentation.

The first commercial mica mining in the United States started in 1803 at the Ruggles Mines in Grafton County, New Hampshire. In the 1800s, mica was used mainly for stove windows, and as shades for open-flame lights.

Sheet mica was first used in vacuum tubes in 1904. With the outbreak of World War I, the demand for vacuum tubes and other electronic components grew, and large quantities of mica were essential for the war effort. Following the war, the mica industry continued to flourish because of the need for mica in the growing radio

and electrical industries. During World War II, mica was essential in the production of sophisticated communication equipment, and the demand for sheet mica reached its peak between 1939 and 1945. After World War II, the mica industry continued to thrive until 1959. Since then, use of other materials in the production of electrical and electronic components has caused a major decline in the mica industry.

Current and Future Demands for Sheet Mica

Since the termination of the government's purchase program in 1962, sheet mica production from domestic reserves has been small. Today, nearly all sheet mica used in the United States is imported, mostly from India. Major problems for domestic sheet mica operations are low demand, special mining techniques and high labor costs. In 1990, domestic sheet mica consumption dropped to 1,870,000 pounds, and demand forecasts for the year 2000 range from 152,000 pounds to 1.8 million pounds. The figures in table 1 show domestic consumption between 1986 and 1990.

Table 1. *U.S. consumption of sheet mica between 1986 and 1990*

Year	Quantity (In pounds)
1986	2,278,000
1987	2,174,000
1988	2,465,000
1989	2,459,000
1990	1,870,000

Source: Mica — 1990 Annual report: U.S. Bureau of Mines.

Electrical Application— The demand for sheet mica in this end use has rapidly declined. Substitute materials are ceramics and plastics. Demand projections for the year 2000 range from 100,000 pounds to 1 million pounds.

Vacuum Tubes — Because of solid-state technology and other developments, demand for sheet mica in this end use may decline to zero. But it is possible that a small amount of sheet mica may still be required for speciality tubes. A tentative forecast for the year 2000 is 2,000 pounds.

Capacitors — Use of sheet mica in the production of capacitors has rapidly declined since the early 1970s. Based on some projections, the use of sheet mica in this product will decline to zero. Other forecasts, however, predict that sheet mica may continue to be used in capacitors that have special electrical characteristics. Also, some mica may be needed for *backing* in certain types of capacitors. A probable forecast for the year 2000 is 3,000 pounds.

Other Uses — It is expected that the demand for sheet mica in other uses also will continue to decline. Use of various substitutes caused a rapid decrease since 1977. However, a slight demand may continue for certain special uses. For example, sheet mica is still in high demand for use in pyrometers, thermal regulators, retardation plates in helium-neon lasers and optical filters. Because mica is transparent, flexible and resistant to chemicals, it is an ideal lining material for gauge glass used in high-pressure steam boilers. In addition, mica is important in the production of washers used in the electronic and computer industries. A tentative forecast for the year 2000 is 100,000 pounds.

Current and Future Demands for Scrap and Flake Mica

Only small amounts of scrap mica are used in scrap form. Most scrap and flake mica is ground for use in various end products. The biggest consumer of ground mica is the construction industry, and demand largely depends on current construction activities. As a result of decreased construction, annual demand for scrap mica dropped

to 120,000 tons in 1990 (table 2). Figures in table 2 show domestic production of scrap mica between 1986 and 1990. Table 3 shows the amount of scrap mica consumed as ground mica, by end use, between 1989 and 1990.

Table 2. *Scrap and flake mica¹ sold or used by producers in the United States between 1986 and 1990*

Year	Quantity (In short tons)
1986	148,000
1987	161,000
1988	143,000
1989	131,000
1990	120,000

¹Includes finely divided mica recovered from mica schist and high-quality sericite schist, and mica that is a byproduct of feldspar, kaolin, and lithium beneficiation.

Source: Mica — 1990 Annual report: U.S. Bureau of Mines.

Table 3. *Ground mica sold or used by producers in the United States, by end use*

End Use	1989 Quantity (In short tons)	1990 Quantity (In short tons)
Joint cement	64,000	58,000
Paint	11,000	15,000
Plastics	3,000	2,000
Well-drilling mud	8,000	8,000
Other ¹	<u>25,000</u>	<u>23,000</u>
Total:	111,000	106,000

¹Includes mica used for molded electrical insulation, rubber, textile and decorative coatings, roofing and miscellaneous. Does not include low-quality sericite (23,000 tons) used in the production of brick.

Source: Mica — 1990 Annual report: U.S. Bureau of Mines.

Gypsum Plasterboard Cement — Ground mica serves as a filler and extender in plasterboard cement (joint cement). Used by the construction industry, this end product represents between 55

and 57 percent of total consumption, with demand expected to rise. However, factors — such as the use of alternate building materials — could affect the demand.

Paints — The paint industry uses ground mica as a pigment extender that also improves the paint film, and increases its resistance to water penetration and weathering. Because of the use of substitute material in some paints, only a small increase in demand is anticipated.

Plastics — In the production of plastics, ground mica is used as a filler and reinforcing agent. A slight increase in demand is expected.

Well Drilling Mud — In the well drilling industry, ground mica is used as an additive to drilling muds. A modest increase in demand is expected.

Brick — Ground mica (low-quality sericite) used in brick may experience a modest increase. This projection is based on increased use of brick for its thermal and decorative properties.

Roofing — In the roofing industry ground mica is used in the production of rolled roofing and in asphalt shingles. The mica serves as an inert filler, and as a surface coating. Use of alternate roofing materials may cause a decline in demand for ground mica in this end use.

Electronic and Electrical Uses — High-quality scrap mica is used mainly in the production of mica paper. Increases in demand may occur as sheet mica is replaced by mica paper in the manufacture of various electrical and thermal appliances.

Molded Rubber Products — The rubber industry uses ground mica as an inert filler and as a mold lubricant in the production of molded rubber products. Use of substitute materials, such as talc and pyrophyllite, and improvements in tire wear may keep consumption at current levels.

Miscellaneous — This end use includes decorative coatings on wallpaper, tile surfaces, and stucco; coatings for cores and molds in metal casting; and as a flux coating on welding rods. Demand for ground mica in this end use is contingent on production levels by consuming industries.

ACKNOWLEDGEMENTS

I appreciate the helpful comments and suggestions made by P. Albert Carpenter, III, and John G. Nickerson, who reviewed the report. Also, I wish to thank Ann Wilson for compiling the Raleigh files, and Jeffrey C. Reid and Leonard S. Wiener for their encouragement and support.
