RE: **DMS Comments on the Draft As-Built Baseline Monitoring Report**
Strawberry Hill, Project ID #100094, DMS Contract #0007745

Comments:

1. DMS recommends using the most current templates and tables for monitoring reports. It is understood that this project was contracted in December 2018 and therefore templates from that time period are applicable. However, the most current templates provide the IRT and DMS with the needed information in a more streamlined and less verbose format.
   Majority of the Report has been updated using the most current template and tables.

2. Recommend adding dates to photos that do not have them either at the top of the page or with each photo.
   Dates have been added to all photos.

3. Please add Limits of Disturbance to the Record Drawings.
   Limits of Disturbance (LOD) have been added to the Record Drawings.

4. Please consider updating the Sheet List Table on the Record Drawing Title Page in the buffer report only by removing the reference to sheets that are not included, or otherwise indicating that only sheets M1 & M2 are included. Also consider a reference to sheet EC2.
   The Sheet List Table has been updated to only include references to sheets M1 and M2. A Cover Page has also been added for the ESC map with a reference to sheet EC2.

5. During the site visit conducted on June 8, 2022 some small, isolated areas of struggling herbaceous growth were observed, specifically a small bare area on JH5 near the tree line and relatively sparse herbaceous cover along some portions of the old farm roads that paralleled JH5 and JH3. Areas did not appear to currently be causing any major issues, but we recommend over seeding this fall if herbaceous vegetation does not more fully establish this summer.
   This area will be monitored this fall and seeded if needed.

6. At the upstream end of JH1-B near Yelverton Grove Road there is a small area that appears to be less than 30' in width, but greater than 20', which would apply a 25% reduction to buffer credits in this area. Please update the buffer credits and report as necessary.
   The revision has been made. The area has been separated out as a unique polygon in the buffer shapefile and a row has been added in the buffer credit table that accounts for the 75% credit stipulation. The resulting credit yield was reduced by 227.498 credits. The report, credit table, and GIS

shapefile have all been updated accordingly.

Digital File Comments:

1. It is not possible to ensure the easement is accurate when compared to the CCPV in the stream asset baseline report, the CCPV does include the entire easement. The digital easement submitted does represent the DMS recorded easement. A requirement of the CCPV is to include the easement boundary, please revise the CCPV in the Stream Baseline Report to include the entire easement boundary. It is complete in the Buffer Baseline Report.
   Figure 2 has been divided into Figure 2a and 2b so that monitoring devices are legible on 2a and the entire conservation easement is visible on 2b.

2. The tables used are not the most updated templates (2020); this project may not have been contracted with these as requirements. The tables are missing the following information:
   a. Project Background is missing regulatory information and pre-existing stream lengths The Project Background tables were updated and display the new requirements.

   b. The goals table is missing from the digital submission and report. The goals table has been added to the report and digital submission.
3. In future submissions, please choose unique names for 'feature name' in buffer excel asset table and use those unique feature names in the digital submission attribute date for buffer feature class. There are numbers on the buffer asset map that are not defined in the legend. This is noted for future submissions, the unique feature names will be consistent.

4. Data missing from the digital submission: Please submit the missing data.
   a. Longitudinal profile is missing, data and graph
      Long pro data and graphs are shown in the as-built record drawings and redlines.

   b. Particle size distribution is missing, data and graph
      This is not a requirement in the approved mitigation plan nor required as part of the monitoring guidance and therefore was not conducted and will not provided in this report.

   c. Photo point spatial data file is missing Photo points have been added.

   d. Station id not included in the raw cross sectional survey data
      A spreadsheet has been added that includes the raw survey data with station id.

   e. Planted zone
      Planted zone has been added.

5. Please refer to DMS As-bult Survey Requirements, item 15; the .dwg file submitted is not adequately attributed.
   All layers were started with "AB-" to symbolize they are part of the As-Built condition. Layer details can be found behind the AB convention.

Table of Contents

1 Project Summary

1.1 Project Location and Description

The Strawberry Hill Mitigation Project ("Project") is located within a mostly rural watershed in Johnston County near Smithfield, NC at the crossroads of Yelverton Grove Road and Brogden Road. The Project lies within the Neuse River Basin, North Carolina United States Geological Survey (USGS) 8-digit Cataloguing Unit 03020201 (Neuse 01) and 14-digit hydrologic unit code (HUC) 03020201140010, a NC Division of Mitigation Services (DMS) Targeted Local Watershed (TLW) and the Division of Water Resources (NCDWR) sub-basin 03-04-02 (**Figure 1**). The Project restores 3,719 linear feet (LF) that will provide water quality benefit for 383 acres of drainage area. Additionally, the Project restores and preserves riparian buffer area within the project area, which provides riparian buffer credits for the Neuse 01 watershed. As-built and baseline conditions pertaining to the buffer mitigation component of this Project will be provided in a separate baseline monitoring report. Also, notably, the Project is in very close proximity (approximately 0.4 miles) to the RES Polecat Stream Mitigation Bank Site, offering even more functional uplift to the local watershed.

The Project area, in whole, is comprised of a 22.12-acre easement involving two unnamed tributaries to Polecat Branch, which eventually drains to the Neuse River. One of the tributary streams, and its associated ditches, are not subject to stream mitigation and are only utilized for buffer mitigation. That portion of the Project will not be discussed in this stream mitigation as-built baseline monitoring report but will be included in a separate baseline monitoring report. Therefore, the stream mitigation component of the Project involves one tributary, whose total length prior to restoration was 3,267 LF.

The Project is accessible from both Yelverton Grove Road and Brogden Road. Coordinates for the Project area are approximately 35.469579, -78.323896 at the NC Department of Transportation (DOT) culvert exiting the Project at Brogden Road.

1.2 Project Components

Prior to restoration, the project stream was significantly impacted by historic relocation and straightening, crop production, timbering, and lack of riparian buffer. Proposed improvements to the Project will help meet the river basin needs expressed in the 2010 Neuse RBRP. Through stream restoration, the Project presents 3,719 LF of proposed stream, generating 3,719.000 Warm Stream Mitigation Units (SMUs). The Project Mitigation Quantities and Credits and Project Attributes are provided below in **Table 1.**

Table 1. Strawberry Hill Mitigation Project (ID-100094) Project Mitigation Quantities and Credit

Project Segment	Original Mitigation Plan Ft/Ac	As-Built Ft/Ac	Original Mitigation Category	Original Restoration Level	Original Mitigation Ratio (X:1)	Credits	Comments
Stream							
Reach JH1-A	1007	1007	Warm	R	1.00000	1,007.000	Channel restoration,installed log structures for grade control and habitat, riparian planting, installed livestakes (Stream Crossing: STA 11+64 to 12+59)
Reach JH1-B	1054	1054	Warm	R	1.00000	1,054.000	Channel restoration,installed log structures for grade control and habitat, riparian planting, installed livestakes, (Stream Crossing: STA 23+13 to 23+74), Removed trash/debris
Reach JH1-B	1658	1658	Warm	R	1.00000	1,658.000	Channel restoration, installed log structures for grade control and habitat, riparian planting, installed livestakes, Removed trash/debris
					Total:	**3,719.000**

Total Stream Credit	**3,719.000**					

1.3 Project Goals and Objectives

Prior to construction the stream had been significantly impacted by historic relocation and straightening, crop production, timbering and lack of riparian buffer. The past land use disturbances, absence of buffer vegetation, and current agricultural practices presented a significant opportunity for water quality and ecosystem improvements through the implementation of this Project. Through the comprehensive analysis of the Project's maximum functional uplift using the Stream Functions Pyramid Framework, specific, attainable goals and objectives are being realized by the Project. These goals clearly help to address the degraded water quality and nutrient input from agricultural practices that were identified as major watershed stressors in the 2010 Neuse River Basin Restoration Priorities (RBRP) (amended August 2018). Ultimately, the Project supports the RBRP Goals listed in the Approved Mitigation Plan. The Project Summary Goals, Performance, and Results are provided below in **Table 2**. The Project Attributes are found in **Table 3**.

Table 2: Summary: Goals, Performance and Results

Goal	Objective/Treatment	Likely Functional Uplift	Performance Criteria	Measurement	Cumulative Monitoring Results
Improve flood flow attenuation on site and downstream by allowing for overbanks flows and connection to the floodplain.	Designed and constructed stream channels sized to convey bankfull flows that will maintain a stable dimension, profile, and planform based on modeling, watershed conditions, and reference reach conditions.	Dispersion of high flows on the floodplain, increase in biogeochemical cycling within the system.	Four bankfull events and within monitoring period. Intermittent stream reaches must have 30 days of consecutive flow.	Stage recorder on JH1-A, and flow gauge on JH1-B.	N/A
To transport water within streams and floodplains in a stable, non-erosive, non-aggrading manner.	Improved flood bank connectivity by reducing bank height ratios and increase entrenchment ratios.	Reduction in sediment inputs from bank erosion, reduction of shear stress, and improved overall hydraulic function.	Bank height ratios remain below 1.2 and entrenchment ratios above 2.2 over the monitoring period. Visual assessments showing progression towards stability.	14 Cross section surveys.	N/A
Restore and preserve native floodplain and streambank vegetation.	Established and increased forested riparian buffers to 50 feet and greater along both sides of the channel along the project reaches with a hardwood riparian plant community.	Reduction in floodplain sediment inputs from runoff, increased bank stability, increased LWD and organic material in streams, increased.	Survival rate of 320 stems per acre at MY3, 260 planted stems per acre at MY5, and 210 stems per acre at MY7.	Seven fixed vegetation plots and four random vegetation plots.	N/A

1.4 Construction and As-Built Conditions

Project construction was completed on January 20th, 2022, and planting was completed on March 7th, 2022. The Strawberry Hill Project was built to design plans and guidelines. The record drawings are included in **Appendix F.**

There were no changes to the planting plan. However, as some high-quality tree species were found within the cutover areas that were timbered over eight years ago, these species were left in place where feasible. Minor monitoring device location changes were made during as-built installation, however, the quantities remained as proposed in the Mitigation Plan.

1.5 Baseline Monitoring Performance (MY0)

The Strawberry Hill Baseline Monitoring activities were performed in February and March 2022. All Baseline Monitoring data is presented below and in the appendices. The Project is on track to meeting stream and vegetation interim success criteria.

1.5.1 Vegetation

Setup and monitoring of the seven permanent vegetation plots and four random vegetation plots were completed after stream construction and planting, on March 7th, 2022 and March 15th, 2022. Vegetation

data are in **Appendix B**, associated photos are in **Appendix B,** and plot locations are in **Appendix A**. MY0 monitoring data indicates that all plots are exceeding the interim success criteria of 320 planted stems per acre. Planted stem densities ranged from 647 to 1,133 planted stems per acre with a mean of 861 planted stems per acre across all plots. A total of twelve planted species were documented within the plots. Two large volunteer species were identified in random plots (*Diospyros virginiana* and *Sambucus canadensis*) and it is expected that more volunteers will establish in upcoming years. The average stem height in the vegetation plots was 1.6 feet.

Visual assessment of vegetation outside of the monitoring plots indicates that herbaceous vegetation is establishing throughout the project area.

1.5.2 Stream Hydrology

One stage recorder and one flow gauge were installed on February 16th, 2022 on reaches JH1-A and JH1-B, respectively. The stage recorder is in place to document bankfull events. The flow gauge is in place to document presence and persistence of stream flow in the intermittent channel. In addition, a camera rig (flow camera) was installed in conjunction with the flow gauge on JH1-B in the attempt to capture daily images of stream flow through the riffle. Stream hydrology data will be included in the Monitoring Year 1 Report in this section and in the appendices. Gauge locations can be found on **Figure 2** and photos are in **Appendix A**.

1.5.3 Stream Geomorphology

Cross section setup and geomorphology data collection for MY0 was collected on February 16th, 2022. Summary tables and cross section plots are in **Appendix C**. Overall, the baseline cross sections and profile relatively match the proposed design. The as-built conditions show that shear stress and velocities have been reduced for all restoration reaches. All reaches were designed as gravel bed channels and remain classified as gravel bed channels post-construction.

Visual assessment of the stream channel was performed to document signs of instability, such as eroding banks, structural instability, or excessive sedimentation. The channel is transporting sediment as designed and will continue to be monitored for aggradation and degradation (**Appendix C**). Since Project construction, a suspected beaver dam has formed offsite, somewhere downstream of reach JH1-B and Brogden Road. This is causing some water to back up within the JH1-B channel near the road; however, most of the water is still contained within the channel and not causing any real inundation in the floodplain at this time. RES will continue to monitor the effect, but the suspected dam is offsite and not within the property of the Project's landowner.

Visual Vegetation Assessment

Planted acreage **19.73**

Vegetation Category	Definitions	Mapping Threshold	Combined Acreage	% of Planted Acreage
Bare Areas	Very limited cover of both woody and herbaceous material.	0.1 acres	0.00	0.0%
Low Stem Density Areas	Woody stem densities clearly below target levels based on current MY stem count criteria.	0.1 acres	0.00	0.0%
	Total			
Areas of Poor Growth Rates	Planted areas where average height is not meeting current MY Performance Standard.	0.25 acres	0.00	0.0%
	Cumulative Total			0.0%

Easement Acreage **22.12**

Vegetation Category	Definitions	Mapping Threshold	Combined Acreage	% of Easement Acreage
Invasive Areas of Concern	Invasives may occur outside of planted areas and within the easement and will therefore be calculated against the total easement acreage. Include species with the potential to directly outcompete native, young, woody stems in the short-term or community structure for existing communities. Species included in summation above should be identified in report summary.	1000 SF	0.00	0.0%
Easement Encroachment Areas	Encroachment may be point, line, or polygon. Encroachment to be mapped consists of any violation of restrictions specified in the conservation easement. Common encroachments are mowing, cattle access, vehicular access. Encroachment has no threshold value as will need to be addressed regardless of impact area.	none	N/A

The above morphology parameters reflect the 2018 guidance that arose from the mitigation technical workgroup consisting of DMS, the IRT and industry mitigation providers/practitioners. The outcome resulted in the focus on three primary morphological parameters of interest for the purposes of tracking channel change moving forward. They are the bank height ratio using a constant As-built bankfull area and the cross sectional area and max depth based on each years low top of bank. These are calculated as follows:

1 - **Bank Height Ratio (BHR)** takes the As-built bankfull area as the basis for adjusting each subsequent years bankfull elevation. For example if the As-built bankfull area was 10 ft2, then the MY1 bankfull elevation would be adjusted until the calculated bankfull area within the MY1 cross section survey = 10 ft2. The BHR would then be calculated with the difference between the low top of bank (LTOB) elevation for MY1 and the thalweg elevation for MY1 in the numerator with the difference between the MY1 bankfull elevation and the MY1 thalweg elevation in the denominator. This same process is then carried out in each successive year.

2 - **LTOB Area and Max depth -** These are based on the LTOB elevation for each years survey (The same elevation used for the LTOB in the BHR calculation). Area below the LTOB elevation will be used and tracked for each year as

Note: The smaller the channel the closer the survey measurements are to their limit of reliable detection, therefore inter-annual variation in morphological measurement (as a percentage) is by default magnified as channel size decereases. Some of the variability above is the result of this factor and some is due to the large amount of depositional sediments observed.

NOTES:

- ALL DISTANCES ARE HORIZONTAL GROUND MEASUREMENTS IN U.S. SURVEY FEET UNLESS OTHERWISE NOTED.
- HORIZONTAL DATUM IS NAD83(2011); VERTICAL DATUM IS NAVD 88
- THIS MAP IS NOT INTENDED FOR RECORDATION, SALES OR CONVEYANCES
- THE PURPOSE OF THIS MAP AND AS-BUILT DRAWING IS TO ILLUSTRATE THE POST- CONSTRUCTION "AS-BUILT CONDITIONS" OF THE STREAM RESTORATION AND MAY NOT SHOW ALL IMPROVEMENTS OR UTILITIES.
- NO PROPERTY LINES WERE SURVEYED, ALL BOUNDARY AND CONSERVATION EASEMENT LINES WERE REFERENCED FROM RECORDED PLATS
- STATE PLANE COORDINATES AND ELEVATIONS WERE DERIVED FROM EXISTING ONSITE CONTROL SURVEY PREPARED AND ESTABLISHED BY WSP USA INC.

SITE MAP
NTS

I, BRIAN S. HOCKETT CERTIFY THAT THIS MAP WAS DRAWN UNDER MY SUPERVISION AND THAT THIS GROUND SURVEY WAS PERFORMED AT THE 90% CONFIDENCE LEVEL TO MEET FEDERAL GEOGRAPHIC DATA COMMITTEE STANDARDS; THAT THIS SURVEY WAS PERFORMED TO MEET THE REQUIIREMENTS FOR A TOPOGRAPHIC/PLANIMETRIC SURVEY TO THE ACCURACY OF CLASS "A" AND VERTICAL ACCURACY WHEN APPLICABLE TO THE CLASS "A" STANDARD, AND THAT THE ORIGINAL DATA WAS OBTAINED ON OCTOBER 27th 2021; THAT THE SURVEY WAS COMPLETED ON MARCH 29th 2022; THAT CONTOURS SHOWN AS BROKEN LINES MAY NOT MEET THE STATED STANDARD; AND ALL COORDINATES ARE BASED ON NAD83 (2011) AND ELEVATIONS ARE BASED ON NAVD88 (GEOID18)

1. CLASS OF SURVEY: CLASS A
2. POSITIONAL ACCURACY: 0.08'
3. TYPE OF GPS FIELD PROCEDURE: RTK/VRS
4. DATES OF SURVEY: 10-27-2021 - 3-29-2022
5. GEOID MODEL: 18
6. UNITS: U.S. SURVEY FEET

WITNESS MY ORIGINAL SIGNATURE, LICENSE NUMBER AND SEAL THIS 13th DAY OF May, 2022, A.D.

Brian S. Hockett
