Responses to DMS Comment letter (dated January 4, 2023)

- MY0 Comment Follow Up:
  - The USACE requested wetland reestablishment areas along UT3 and UT4 be captured with random plots in future monitoring. A random plot was included for UT4, but no random plots were included in reestablishment areas along UT-3. Please include these areas in future monitoring efforts.
    No random plots were performed in the reestablishment areas along UT3; however, permanent plot 20 was moved to demonstrate vegetation performance success within this credit area. A random plot can be included in this area during MY2 (2023), if requested.

  - Several members of the IRT had questions regarding the growing season dates. Clearwater has indicated in the report that the growing season will be based on the latest 30-year WETS data (Station Asheboro 2 W, NC) and is defined as March 18 to November 16. Thank you for making this change.

  - DWR requested either Veg Plot 19 or 20 be relocated to nearby wetland reestablishment areas. Veg Plot 20 was relocated during MY1 to the opposite side of UT3 which is in a wetland reestablishment area as requested.

- In an effort to identify and resolve property issues, please verify the conservation easement has been inspected, marking is up to date, fencing is intact, and no encroachments have been identified.
  A short paragraph was added to Section 3.4 (Monitoring Year 1 Summary) indicating that the easement was inspected, is well-marked, all fencing is intact, and no encroachment was observed.

- Table of Contents, Appendix A: Table 4A-H should be 4A-I. There are currently two tables labeled 4H. Please update accordingly. Section 3.1 also references 4A-H.
  The second table 4H was labeled 4I, and all references to the tables were updated.

- Page 5 Monitoring Summary Table: Table indicates 9 gauges were installed. This should be 10.
  This was changed to indicate 10 gauges.

- Table 6A: Recommend adding species common name similar to Table 6B.
  Common names were added to Table 6A.

- Vegetation: Approximately 1/3 of the fixed plots either have dominant species composition greater than 50% or have a low species count. Does Clearwater have concerns with the species diversity at the site?
  Overall, species diversity is not a concern at this time. Dominant species composition and low species counts within plots do not represent a site-wide lack of diversity. Species diversity will continue to be monitored through the coming years, and a planting targeted at species diversity will be proposed if deemed necessary.

- Groundwater Gauge 4 Graph: Suggest revising Graph 4, the label of '7 days' is confusing in that it indicates a time frame greater than 7 days by calling out two 7-day periods. Please revise for clarity.
  The gauge 4 graph was edited to show two separate callout boxes with two separate arrows. This should clarify that two separate 7-day periods occurred.

- Table 14: Please add two lines below MY1 Monitoring Report for Vegetation Survey and Stream Survey and include dates that data collection occurred for each entry.
  These rows were added to Table 14.

Digital Deliverable Review:

- No comments. Please submit updated files based on comments above.

1.0 PROJECT SUMMARY

Clearwater Mitigation Solutions has established the North Carolina Division of Mitigation Services (NCDMS) Bull Chute Stream & Wetland Mitigation Site (hereafter referred to as the "Site"). The Site includes Unnamed Tributaries (UTs) to Caraway Creek in the Southern Outer Piedmont ecoregion of North Carolina. The Site is located in the Yadkin River Basin, cataloguing unit 03040103 and Targeted Local Watershed and Local Watershed Plan Area (Caraway Creek) 03040103050040 and North Carolina Division of Water Resources (NCDWR) subbasin number 03-08-38. Site watersheds range from approximately 0.008 of a square mile (5.4 acres) on UT2 to 0.19 of a square mile (120.9 acres) at the Site's outfall.

1.1 Project Background, Components, and Structure

Located in Randolph County, less than one-mile northwest of New Market and 4.5 miles northwest of Randleman, the Site encompasses 31.7 acres. Restoration activities within the Site included the construction of meandering, E/C-type stream channel resulting in 6974 linear feet of Priority I stream restoration, 617 linear feet of stream enhancement (Level I), 833 linear feet of stream enhancement (Level II), 450 linear feet of stream enhancement (Level II with an adjusted ratio), 3.13 acres of riparian wetland re-establishment, 0.114 acres of riparian wetland rehabilitation, and 1.462 acre of riparian wetland enhancement. The site is expected to provide 7742.933 warm water stream credits and 3.937 riparian wetland credits by closeout (Table 1, page 2). A conservation easement was granted to the State of North Carolina and recorded at the Randolph County Register of Deeds on April 9, 2021.

Prior to construction, the Site was characterized by disturbed forest and livestock pasture. Site design was completed in May 2021. Construction started on September 6, 2021 and ended within a final walkthrough on March 8, 2022. The Site was planted on March 18, 2022. Completed project activities, reporting history, completion dates, and project contacts are summarized in Tables 14-15 (Appendix E).

Table 2. Summary: Goals, Performance, and Results

Goals	Objectives	Success Criteria
(1) HYDROLOGY		
• Minimize downstream flooding to the maximum extent possible.	• Construct new channel at historic floodplain elevation to restore overbank flows • Plant woody riparian buffer • Deep rip floodplain soils to reduce compaction and increase soil surface roughness • Protect riparian buffers with a perpetual conservation easement • Construct channels with proper pattern, dimension, and longitudinal profile	• BHR not to exceed 1.2 • Document four overbank events in separate monitoring years • Continuous intermittent surface flow for at least 30 days • Livestock excluded from the easement • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria • Conservation Easement recorded
• Increase stream stability within the Site so that channels are neither aggrading nor degrading.	• Construct channels with proper pattern, dimension, and longitudinal profile • Remove livestock from the property • Construct stable channels with appropriate substrate • Upgrade existing piped channel crossings and install piped crossings at existing forded crossings • Stabilize stream banks • Plant woody riparian buffer	• Cross-section measurements indicate a stable channel with appropriate substrate • Visual documentation of stable channels and structures • BHR not to exceed 1.2 • < 10% change in BHR in any given year • Livestock excluded from the easement • Attain Vegetation Success Criteria
(1) WATER QUALITY		
• Remove direct nutrient and pollutant inputs from the Site and reduce contributions to downstream waters.	• Remove agricultural livestock and reduce agricultural land/inputs • Install marsh treatment areas • Plant woody riparian buffer • Restore/enhance jurisdictional wetlands adjacent to Site streams • Provide surface roughness and reduce compaction through deep ripping/plowing • Restore overbank flooding by constructing channels at historic floodplain elevation	• Livestock excluded from the easement • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria
(1) HABITAT		
• Improve instream and stream-side habitat.	• Construct stable channels with appropriate substrate • Plant woody riparian buffer to provide organic matter and shade • Construct new channel at historic floodplain elevation to restore overbank flows • Protect riparian buffers with a perpetual conservation easement • Restore/enhance jurisdictional wetlands adjacent to Site streams • Stabilize stream banks • Install in-stream structures	• Cross-section measurement indicate a stable channel with appropriate substrate • Visual documentation of stable channels and in-stream structures. • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria • Conservation Easement recorded

1.2 Success Criteria

Monitoring and success criteria for stream restoration should relate to project goals and objectives identified from on-site NC SAM and NC WAM data collection. From a mitigation perspective, several of the goals and objectives are assumed to be functionally elevated by restoration activities without direct measurement. Other goals and objectives will be considered successful upon achieving success criteria. The following summarizes Site annual success criteria.

Success Criteria

Streams
• All streams must maintain an Ordinary High-Water Mark (OHWM), per RGL 05-05. • Continuous surface flow in intermittent streams must be documented each year for a minimum of 30 consecutive days. • Bank height ratio (BHR) cannot exceed 1.2 at any measured cross-section. • BHR at any measure riffle cross-section should not change by more than 10% from baseline condition during any given monitoring period. • The stream project shall remain stable and all other performance standards shall be met through four separate bankfull events, occurring in separate years, during the monitoring years 1-7.
Wetland Hydrology
• Saturation or inundation, measured annually, within the upper 12 inches of the soil surface for, at a minimum, 12 percent of the growing season*, during average climatic conditions.
Vegetation
• Within planted portions of the site, a minimum of 320 stems per acre must be present at year 3; a minimum of 260 stems per acre must be present at year 5; and a minimum of 210 stems per acre must be present at year 7. • Trees must average 7 feet in height at year 5, and 10 feet in height at year 7 in each plot. • Planted and volunteer stems are counted, provided they are included in the approved planting list for the site; natural recruits not on the planting list may be considered by the IRT on a case-by-case basis. • Any volunteer species on the approved planting list must be established for at least 2 years to count towards success and will be subject to the average height standard.

*In accordance with IRT request after submittal of the MY0 report, the growing season for this site will be based on the latest 30-year WETS data (Station Asheboro 2 W, NC) and is defined as March 18 to November 16.

2.0 PROJECT MONITORING – METHODS

Monitoring will be conducted in accordance with 2016 NCIRT Guidelines. Monitoring will be conducted by Axiom Environmental, Inc based on the schedule below. A summary of monitoring is outlined in Section 3.1. Annual monitoring reports will be submitted to the NCDMS by Restoration Systems no later than December 1 of each monitoring year data is collected.

Monitoring Schedule

Resource	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7
Streams							
Wetlands							
Vegetation							
Visual Assessment							
Report Submittal							

2.1 Monitoring

The monitoring parameters are summarized in the following table.

Monitoring Summary

Stream Parameters				
Parameter	**Method**	**Schedule/Frequency**	**Number/Extent**	**Data Collected/Reported**
Stream Profile	Full longitudinal survey	As-built (unless otherwise required)	All restored stream channels	Graphic and tabular data.
Stream Dimension	Cross-sections	Years 1, 2, 3, 5, and 7	Total of 26 cross-sections on restored channels	Graphic and tabular data.
Channel Stability	Visual Assessments	Yearly	All restored stream channels	Areas of concern will be depicted on a plan view figure with a written assessment and photograph of the area included in the report.
	Additional Cross-sections	Yearly	Only if instability is documented during monitoring	Graphic and tabular data.
Stream Hydrology	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	6 surface water gauges on UT 1, UT 2, UT 3, UT 4A, UT 4B, and UT 7	Surface water data for each monitoring period
Bankfull Events	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	3 crest gauges on UT 1, UT 3, and UT 4	Surface water data for each monitoring period
	Visual/Physical Evidence	Continuous through monitoring period	Periodic Site visits throughout the year.	Visual evidence, photo documentation, and/or rain data.
Wetland Parameters				
Parameter	**Method**	**Schedule/Frequency**	**Number/Extent**	**Data Collected/Reported**
Wetland Restoration	Groundwater gauges	Years 1, 2, 3, 4, 5, 6, and 7 throughout the year with the growing season defined as March 18-November 16*	10 gauges spread throughout restored wetlands	Groundwater and rain data for each monitoring period
Vegetation Parameters				
Parameter	**Method**	**Schedule/Frequency**	**Number/Extent**	**Data Collected/Reported**
Vegetation establishment and vigor	Permanent vegetation plots 0.0247 acre (100 square meters) in size; *CVS-EEP Protocol for Recording Vegetation, Version 4.2* (Lee et al. 2008)	As-built, Years 1, 2, 3, 5, and 7	21 plots spread across the Site	Species, height, planted vs. volunteer, stems/acre
	Annual random vegetation plots, 0.0247 acre (100 square meters) in size	As-built, Years 1, 2, 3, 5, and 7	10 plots randomly selected each year	Species and height

*In accordance with IRT request after submittal of the MY0 report, the growing season for this site will be based on the latest 30-year WETS data (Station Asheboro 2 W, NC, 1992-2022) and is defined as March 18 to November 16 (244 days). Soil temperature and bud burst documentation will not be required to verify growing season start dates.

Note: Photo points will be taken at all cross sections and at vegetation plot origin points. In addition, photo points will be located at all culverts and crossings.

3.0 MONITORING YEAR 1 – DATA ASSESSMENT

Annual monitoring and site visits were conducted between April and November 2022 to assess the condition of the project. Stream, wetland, and vegetation criteria for the Site follow the approved success criteria presented in the Mitigation Plan and summarized in Section 1.2; monitoring methods are detailed in Section 2.0.

3.1 Stream Assessment

Morphological surveys for MY1 were conducted on November 29, 2022. All streams within the Site are stable and functioning as designed. Refer to Appendix A for the Visual Stream Morphology Stability Assessment Table (Table 4A-I) and Stream Photographs. Refer to Appendix C for Stream Geomorphology Data. No stream areas of concern were identified during MY1 (2022).

Three bankfull events were documented during MY1 (2022) (Table 11, Appendix D).

Additionally, all Site tributaries showed evidence of channel formation during MY1 (2022), with each stream flow gauge documenting greater than 30 consecutive days of flow (Tables 13A-F and Flow Gauge Graphs, Appendix D).

3.2 Hydrology Assessment

Seven of the 10 groundwater monitoring gauges met success criteria during MY1 (2022). Due to construction and fencing activities, gauges were unable to be installed until April 5 and May 18, 2022. Gauge 1 captured a hydroperiod of just 1 day and, which is likely because it was installed along one of the final reaches to complete construction. With normal rainfall and adequate time for groundwater to recharge in this area, it is expected to meet success criteria during MY2 (2023). Gauge 3 was not installed until May 18 due to ongoing fencing construction activities along this reach. It captured a 19-day (7.8%) hydroperiod after its installation, and it is expected to have met success criteria if installed earlier in the growing season. Gauge 4 was installed in a non-credit-generating area to monitor the possible formation of wetlands after the removal of drain tile upstream of the UT-1 origin. MY1 (2022) hydrology data indicates uncertainty in wetland development in this area, but it will be monitored during future years for possible wetland formation.

3.3 Vegetative Assessment

The MY1 (2022) vegetative survey was completed on August 30, 2022. Vegetation monitoring resulted in a sitewide stem density average of 609 planted stems per acre, above the interim requirement of 320 stems per acre required at MY3. All 21 fixed vegetation plots and 10 temporary plots met the interim success criteria. Please refer to Appendix A for Vegetation Plot Photographs and the Vegetation Condition Assessment Table, and Appendix B for MY1 Vegetation Plot Data. No vegetation areas of concern were identified during MY1.

3.4 Monitoring Year 1 Summary

Overall, the Site looks good, is performing as intended, and is on track to meet success criteria. All vegetation plots are on track to exceed the MY3 interim requirement of 320 planted stems per acre, wetlands are trending toward success, and all streams within the Site are stable and are meeting project goals.

The conservation easement boundary was inspected during MY1. The easement is well-marked with up-to-date signage, and all fencing is intact. No areas of easement encroachment were observed during MY1.

Assessed Stream Length 1907 Survey Date: November 29, 2022

Assessed Bank Length 3814

Major Channel Category		Metric	Number Stable, Performing as Intended	Total Number in As-built	Amount of Unstable Footage	% Stable, Performing as Intended
Bank	**Surface Scour/Bare Bank**	Bank lacking vegetative cover resulting simply from poor growth and/or surface scour			0	100%
	Toe Erosion	Bank toe eroding to the extent that bank failure appears likely. Does NOT include undercuts that are modest, appear sustainable and are providing habitat.			0	100%
	Bank Failure	Fluvial and geotechnical - rotational, slumping, calving, or collapse			0	100%
Totals					0	100%
Structure	**Grade Control**	Grade control structures exhibiting maintenance of grade across the sill.	30	30		100%
	Bank Protection	Bank erosion within the structures extent of influence does not exceed 15%. (See guidance for this table in DMS monitoring guidance document)	30	30		100%

Table 5. Visual Vegetation Assessment

Planted acreage **28.5**

Vegetation Category	Definitions	Mapping Threshold	Combined Acreage	% of Planted Acreage
Bare Areas	Very limited cover of both woody and herbaceous material.	0.10 acres	0.00	0.0%
Low Stem Density Areas	Woody stem densities clearly below target levels based on current MY stem count criteria.	0.10acres	0.00	0.0%
		Total	0.00	0.0%
Areas of Poor Growth Rates	Planted areas where average height is not meeting current MY Performance Standard.	0.10 acres	0.00	0.0%
		Cumulative Total	0.00	0.0%

Easement Acreage **31.7**

Vegetation Category	Definitions	Mapping Threshold	Combined Acreage	% of Easement Acreage
Invasive Areas of Concern	Invasives may occur outside of planted areas and within the easement and will therefore be calculated against the total easement acreage. Include species with the potential to directly outcompete native, young, woody stems in the short-term or community structure for existing communities. Species included in summation above should be identified in report summary.	0.10 acres	0.00	0.0%
Easement Encroachment Areas	Encroachment may be point, line, or polygon. Encroachment to be mapped consists of any violation of restrictions specified in the conservation easement. Common encroachments are mowing, cattle access, vehicular access. Encroachment has no threshold value as will need to be addressed regardless of impact area.	none	0 Encroachments noted

Post Mitigation Plan Performance Standard	Current Year Stem Count				10	13	16	10	9	14	11	10	10	16
	Stems/Acre				324	445	648	405	364	567	324	405	405	648
	Species Count				2	3	5	4	6	4	3	4	4	4
	Dominant Species Composition (%)				70	62	38	50	33	50	73	40	40	38
	Average Plot Height (ft.)				2	2	1	2	1	1	1	2	2	2
	% Invasives				0	0	0	0	0	0	0	0	0	0

1). Bolded species are proposed for the current monitoring year, italicized species are not approved, and a regular font indicates that the species has been approved.
2). The "Species Included in Approved Mitigation Plan" section contains only those species that were included in the original approved mitigation plan. The "Post Mitigation Plan Species" section includes species that are being proposed through a mitigation plan addendum for the current monitoring year (bolded) , species that have been approved in prior monitoring years through a mitigation plan addendum (regular font), and species that are not approved (italicized).
3). The "Mitigation Plan Performance Standard" section is derived only from stems included in the original mitigation plan, whereas the "Post Mitigation Plan Performance Standard" includes data from mitigation plan approved, post mitigation plan approved, and proposed stems.

Bank Height Ratio_Based on AB Bankfull[1] Area							
Thalweg Elevation							
LTOB[2] Elevation							
LTOB[2] Max Depth (ft)							
LTOB[2] Cross Sectional Area (ft^2)							

The above morphology parameters reflect the 2018 guidance that arose from the mitigation technical workgroup consisting of DMS, the IRT and industry mitigation providers/practitioners. The outcome resulted in the focus on three primary morphological parameters of interest for the purposes of tracking channel change moving forward. They are the bank height ratio using a constant As-built bankfull area and the cross sectional area and max depth based on each years low top of bank. These are calculated as follows:

1 - **Bank Height Ratio (BHR)** takes the As-built bankful area as the basis for adjusting each subsequent years bankfull elevation. For example if the As-built bankfull area was 10 ft2, then the MY1 bankfull elevation would be adjusted until the calculated bankfull area within the MY1 cross section survey = 10 ft2. The BHR would then be calculated with the difference between the low top of bank (LTOB) elevation for MY1 and the thalweg elevation for MY1 in the numerator with the difference between the MY1 bankfull elevation and the MY1 thalweg elevation in the denominator. This same process is then carried out in each successive year.

2 - **LTOB Area and Max depth -** These are based on the LTOB elevation for each years survey (The same elevation used for the LTOB in the BHR calculation). Area below the LTOB elevation will be used and tracked for each year as above. The difference between the LTOB elevation and the thalweg elevation (same as in the BHR calculation) will be recroded and tracked above as LTOB max depth.

Note: The smaller the channel the closer the survey measurements are to their limit of reliable detection, therefore inter-annual variation in morphological measurement (as a percentage) is by default magnified as channel size decereases. Some of the variability above is the result of this factor and some is due to the large amount of depositional sediments observed.

Thalweg Elevation							
LTOB[2] Elevation							
LTOB[2] Max Depth (ft)							
LTOB[2] Cross Sectional Area (ft^2)							

The above morphology parameters reflect the 2018 guidance that arose from the mitigation technical workgroup consisting of DMS, the IRT and industry mitigation providers/practitioners. The outcome resulted in the focus on three primary morphological parameters of interest for the purposes of tracking channel change moving forward. They are the bank height ratio using a constant As-built bankfull area and the cross sectional area and max depth based on each years low top of bank. These are calculated as follows:

1 - **Bank Height Ratio (BHR)** takes the As-built bankfull area as the basis for adjusting each subsequent years bankfull elevation. For example if the As-built bankfull area was 10 ft2, then the MY1 bankfull elevation would be adjusted until the calculated bankfull area within the MY1 cross section survey = 10 ft2. The BHR would then be calculated with the difference between the low top of bank (LTOB) elevation for MY1 and the thalweg elevation for MY1 in the numerator with the difference between the MY1 bankfull elevation and the MY1 thalweg elevation in the denominator. This same process is then carried out in each successive year.

2 - **LTOB Area and Max depth** - These are based on the LTOB elevation for each years survey (The same elevation used for the LTOB in the BHR calculation). Area below the LTOB elevation will be used and tracked for each year as above. The difference between the LTOB elevation and the thalweg elevation (same as in the BHR calculation) will be recroded and tracked above as LTOB max depth.

Note: The smaller the channel the closer the survey measurements are to their limit of reliable detection, therefore inter-annual variation in morphological measurement (as a percentage) is by default magnified as channel size decereases. Some of the variability above is the result of this factor and some is due to the large amount of depositional sediments observed.

Table 13A. UT-1 Channel Evidence

UT-1 Upstream Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	105
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
Other:	

Table 13B. UT-2 Channel Evidence

UT-2 Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	124
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
Other:	

Table 13C. UT-3 Channel Evidence

UT-1 Upstream Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	239
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
Other:	

Table 13D. UT-7 Channel Evidence

UT-2 Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	124
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
Other:	

Table 13E. UT-4A Channel Evidence

UT-1 Upstream Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	239
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
Other:	

Table 13F. UT-4B Channel Evidence

UT-2 Channel Evidence	Year 1 (2022)
Max consecutive days channel flow	239
Presence of litter and debris (wracking)	Yes
Leaf litter disturbed or washed away	Yes
Matted, bent, or absence of vegetation (herbaceous or otherwise)	Yes
Sediment deposition and/or scour indicating sediment transport	Yes
Water staining due to continual presence of water	Yes
Formation of channel bed and banks	Yes
Sediment sorting within the primary path of flow	Yes
Sediment shelving or a natural line impressed on the banks	Yes
Change in plant community (absence or destruction of terrestrial vegetation and/or transition to species adapted for flow or inundation for a long duration, including hydrophytes)	Yes
Development of channel pattern (meander bends and/or channel braiding) at natural topographic breaks, woody debris piles, or plant root systems	Yes
Exposure of woody plant roots within the primary path of flow	No
