EXECUTIVE SUMMARY

The Glen Raven Stream Restoration Site is a full-delivery project that was developed for the North Carolina Ecosystem Enhancement Program (EEP). Construction was completed in March 2007 on an unnamed tributary to the Haw River (UTHR) and two of its tributaries (UT1 and UT2). The 697-acre project watershed is located within the USGS 14-digit HUC 03030002030010 and the NCDWQ Sub-basin 03-06-02 in the Cape Fear River Basin. The project restored approximately 3,317 linear feet of channel using a combination of Priority 2 and 3 approaches, and enhanced 450 linear feet using a Priority 2 approach, generating 3,405 stream mitigation units. The design addressed vertical instability problems and a lack of bed variability by stabilizing stream banks, installing in-stream structures, adjusting stream planform, and clearing and replanting the riparian areas with native vegetation. This report describes the results from the findings of the third year of monitoring that took place in 2009.

The riparian buffer was planted with fifteen different species of bare root trees and shrubs and four different species of live stakes. Eight vegetation monitoring plots were established during the as-built survey. Riparian vegetation must meet a minimum survival success rate of 320 stems/acre after five years. The third year of monitoring counted an average of 565 stems per acre. Some invasive species were noted in the restored stream buffer and will continue to be monitored to determine if corrective action is necessary. The third year of monitoring found the vegetation component of the project to be on track to meeting the vegetative success criteria.

The stream assessment completed during third-year monitoring found the stream to be stable and functioning properly. Channel dimensions have not changed significantly from second-year monitoring conditions. Small portions of localized floodplain erosion were noted during the third year of monitoring and the beaver dams reported during the second year of monitoring have been removed. These areas have been documented in the Current Conditions Plan View. The on-site stream gauges have recorded thirteen bankfull events since the beginning of 2008. This includes the over three-inch rain event from by Tropical Storm Hanna, which caused the stream stage to crest at almost three feet above bankfull.

1.0 PROJECT BACKGROUND

1.1 Project Objectives

- Establish a stable C4 stream channel on the UTHR and a B4c stream channel on UT1 and UT2.
- Create a heterogeneous stream bed with distinct pool and riffle features.
- Plant a riparian buffer with site-appropriate native trees and shrubs.

1.2 Project Structure, Restoration Type, and Approach

The project site became degraded as a result of agricultural activities (poor grazing management) and human disturbances (removal of riparian vegetation and development in the watershed). As a result, the ecological diversity and water quality of the site were adversely affected. The project restored 3,317 linear feet of channel using a combination of Priority 2 and 3 approaches, and enhanced 450 linear feet using a Priority 2 approach. UTHR was restored to a Rosgen stream type C4, and UT1 and UT2 were restored to stream type B4c. The riparian buffer was planted with native trees and shrubs.

1.3 Location and Setting

The Glen Raven Stream Restoration Site is located 1.5 miles northwest of Burlington, North Carolina in Alamance County. The land use of the 697-acre project watershed is comprised of suburban residential development, forest, and agriculture. The watershed has a high potential for future development.

From Raleigh, proceed west on Interstate 40 (I-40). Continue on I-40 West/ I-85 South after they merge near Hillsborough. Take Exit 148 and turn right towards Burlington. Proceed to the split of NC-54/49 and NC-87/100. Turn right heading northwest on NC-87/100. Proceed to the split of NC-87 and NC-100 in Glen Raven. Turn right and travel north 0.15 mile on NC-87. Make a left onto Power Line Road and proceed 0.7 mile. The project site begins just downstream of the Power Line Road culvert (Figure 1).

2.0 PROJECT CONDITIONS AND MONITORING RESULTS

2.1 Vegetation Assessment

The planted vegetation on the site is growing well with high rates of survival. Volunteers have also started to populate the site. Upstream of Gerringer Road, there are many sweetgum (*Liquidambar styraciflua*) volunteer seedlings and downstream of Gerringer Road river birch (*Betula nigra*) seedlings are prevalent. Appendix A contains tables that show the survivability of the planted trees and summarize the data from the permanent monitoring plots. This year's monitoring results reveal high survival rates of the planted stems from last year. Of the 117 planted stems counted during the second monitoring year, only four died in the third monitoring year. Most of the floodplain and stream banks have established vegetation. Invasive species identified on the site include Chinese lespedeza (*Lespedeza cuneata*), multiflora rose (*Rosa multiflora*), Chinese privet (*Ligustrum sinense*), and Japanese honeysuckle (*Lonicera japonica*). Due to the suburban setting of the project site, most of these exotic plants are likely introduced from properties adjacent to the project. The exotic vegetation is not widespread across the project, but these populations will be monitored to determine if control measures will be required in the future. For further vegetation data see, Appendix A.

2.2 Stream Assessment

The third year of monitoring found the physical components of the stream to be stable. The morphological monitoring revealed that the cross-sections and the longitudinal profile have changed only minimally since the second-year monitoring. The changes that have occurred do not indicate a trend toward an unstable condition. There were no new problem areas since last year's monitoring and many of the areas that were previously called out as potential problem areas have stabilized. As reported last year, a few spots within the floodplain have eroded due to large flows accessing the floodplain. These areas have become more stable as they become rooted with vegetation. The beaver dams that were found during the last year's monitoring have been removed, and as of November 2009 there were no beaver dams on the Glen Raven site. For more information on the monitored cross-sections and the longitudinal profile, see Appendix B.
