1.0 EXECUTIVE SUMMARY

The Greenbrier Stream Restoration Site (Site) is situated within the United States Geological Society (USGS) hydrologic unit **03030003** and North Carolina Division of Water Quality (NCDWQ) Priority Sub-basin 03-06-12. The Site is located approximately 8 miles north of Siler City at the crossing of Staley-Snow Camp/Pleasant Hill Church Road over Greenbrier Creek. The Site is encompassed within a 50.48 acre easement located in three parcels, individually owned by Jerrold Murchison (32.94 acres), Charles Cheek (0.52 acres), and Larry Matthews (17.02 acres). Primary land uses were active row crop production on the Murchison parcel and active pasture on the Matthews/Cheek parcels. Project streams, Greenbrier Creek and an Unnamed Tributary (UT) to Greenbrier Creek, became impaired from poor land management, stream dredging, upstream disturbances, and human impacts. This report (compiled based on North Carolina Ecosystem Enhancement Program (EEP)'s *Procedural Guidance and Content Requirements for EEP Monitoring Reports* Version 1.4 dated 11/7/11) summarizes data for Year 2 (2013) annual monitoring.

The project goals are to:

- Improve water quality by reducing nutrient loading from a livestock operation in a water supply watershed.
- Reduce the high level of sediment loading to the stream from steep, eroding banks.
- Improve both aquatic and terrestrial riparian buffer habitat.

These goals will be accomplished through the implementation of the following objectives:

- Preservation and protection of important wetlands and stream channel reaches upstream of the Matthews property.
- Improvement of water quality (reduction of nutrient and sediment inputs) by creating a vegetated riparian buffer filter strip between the stream and livestock operations currently on the property.
- Reduction of high sediment loads in the stream through stabilization of eroding channel banks.
- Improvement of deteriorated aquatic habitat by reduction of nutrient and sediment loads in the streams, providing more variable stream channel geometry and creating more opportunities for carbon inputs from trees in the restored buffer zone.
- Improvement of terrestrial habitat through restoration of diverse native woody vegetation in the riparian buffer zone and control of invasive Chinese privet (*Ligustrum sinense*).

During Year 2 (2013) monitoring, twelve (12) vegetation plots were sampled. Ten (10) of the twelve (12) plots met or exceeded the success criteria of 320 stems/acre (minimum stem count after 3 years). The two plots below success criteria (plots 5 and 6) had 243 and 283 stems per acre, respectively. However, when including naturally recruited stems of black walnut (Juglans nigra), plot 6 exceeds success criteria. Plots 5 and 6 are adjacent to the unnamed tributary, which is characterized by dense fescue that may be outcompeting planted bare root seedlings. Supplemental planting at the Site occurred on February 13 and 14, 2012, in response to the contractor's vegetation warranty assessment (Appendix F). During this effort, 1952 bare root and 1 gallon trees were planted at the Site. Supplemental planting appears to have resulted in vegetative success across the majority of the Site.

Chinese privet (*Ligustrum sinense*) and Japanese privet (*Ligustrum japonicum*) are scattered throughout the site; however, several occurrences (two areas upstream of the confluence, one smaller area along the easement boundary downstream of the bridge, and one area just downstream of the ford (near cross-section 12) are particularly dense (Figure 2A, Appendix B). In addition, scattered stems of Bradford pear (*Pyrus calleryana*) and multiflora rose (*Rosa multiflora*) are present in minimal numbers within the Site. Herbaceous species including Japanese stiltgrass (*Microstegium vimineum*) and fescue (*Festuca* sp.) are found across the entire Site. Microstegium is found in portions of the Site that are covered by mature

canopy along the upstream portion of the unnamed tributary, downstream portions of Greenbrier Creek, and throughout the preservation reach. Fescue is found in open areas previously maintained as pasture; these areas appear to have poor planted stem survival.

With the exception of the previously impounded area, vegetation within the preservation reach is well-established with scattered occurrences of invasive species. Japanese honeysuckle (*Lonicera japonica*), Chinese privet (*Ligustrum sinense*), and microstegium (*Microstegium vimineum*) were observed scattered throughout the reach.

A visual assessment and geomorphic survey were completed for the Site, and indicated that the project reaches were performing within established success criteria ranges as shown below. Due to contracting issues, no baseline data was collected for this project. Although there are no baseline cross-sections to compare with Year 2 (2013) measurements, the Year 1 (2012) cross-sections should serve as an adequate baseline. No significant bank erosion was recorded. In addition, no significant aggradation or degradation of the bed was noted.

One bankfull event was recorded during the year 2 (2013) monitoring season for a total of two bankfull events with one occurring each monitoring year.

Stream Success Criteria (from approved Restoration Plan 2008):

- Success is defined as the documentation of no substantial aggradation or degradation of the channel or banks.
- Downcutting, deposition, bank erosion, and an increase in sands or finer substrate material must be documented for assessment by the regulatory agencies.
- Comparison of the existing conditions BEHI values with the BEHI values computed after vegetation is established will indicate bank stabilization trajectories.
- A minimum of two bankfull events must occur in separate years within the five-year monitoring.

Beaver have been an ongoing issue on the Site and are being closely monitored. Three previously noted beaver dams located 1) downstream of the Staley Snow Camp bridge crossing, 2) at Cross-section 12, and 3) at Cross-section 13 were removed by APHIS in May 2013 and were not present during monitoring activities. Currently, one large, well-established impoundment is located on the preservation reach consisting of several beaver dams. One large dam was destroyed in the summer of 2013, but it appears as though the beaver are still active in this area. Few woody stems are surviving in the impoundment footprint, and no natural recruits are becoming established at this time. This impoundment area is shown on the Current Conditions Plan View Map (Figure 2B).

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in tables and figures within this report's appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on EEPs website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

2.0 METHODOLOGY

2.1 Vegetation Assessment

Twelve vegetation plots were established and marked after construction with four-foot metal U-bar post demarking the corners with a ten foot, three-quarter inch PVC at the origin. The plots are 10 meters

square and are located randomly within the Site. These plots were surveyed in July for the Year 2 (2013) monitoring season using the *CVS-EEP Protocol for Recording Vegetation, Version 4.2* (Lee et al. 2008) (http://cvs.bio.unc.edu/methods.htm); results are included in Appendix C. The taxonomic standard for vegetation used for this document was *Flora of the Carolinas, Virginia, Georgia, and Surrounding Areas* (Weakley 2007).

2.2 Stream Assessment

Annual stream monitoring was conducted in May 2013. Fourteen permanent cross-sections, eight riffle and six pool, were established and will be used to evaluate stream dimension; locations are depicted on Figure 2 (Appendix B). Cross-sections are permanently monumented with 4-foot metal garden posts at each end point. Cross-sections will be surveyed to provide a detailed measurement of the stream and banks including points on the adjacent floodplain, top of bank, bankfull, breaks in slope, edge of water, and thalweg. Data will be used to calculate width-depth ratios, entrenchment ratios, and bank height ratios for each cross-section. In addition, photographs will be taken and pebble counts will be conducted at each permanent cross-section location annually.

Two monitoring reaches were established (the unnamed tributary and Greenbrier Creek) and will be used to evaluate longitudinal profile; locations are depicted on Figure 2 (Appendix B). Longitudinal profile measurements will include average water surface slopes and facet slopes and pool-to-pool spacing. Measurements of channel pattern (belt-width, meander length, and radius of curvature) was proposed for Year 1 (2012); however, the design channel was developed at a sinuosity of 1.0, resulting in no measurable meander bends, belt widths, or radius of curvature. Two crest gauges were installed onsite; one on the unnamed tributary and one on Greenbrier Creek, upstream of the confluence. These will be used to document bankfull events throughout the monitoring period. Additionally, thirty-one permanent photo points were established throughout the restoration reach (14 cross-sections, 12 vegetation plots, and 5 fixed station photos). Photographs are included in the Appendices.

Table 6 Vegetation Condition Assessment

Planted Acreage[1] **16.5**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	Very limited cover of planted woody and herbaceous material on stream banks	0.1 acres	N/A	0	0.00	0.0%
2. Low Stem Density Areas	Woody stem densities clearly below target levels based on visual observations and MY3 stem count criteria.	0.1 acres	N/A	0	0.00	0.0%
			Total		0.00	0.0%
3. Areas of Poor Growth Rates or Vigor	Areas with woody stems of a size class that are obviously small given the monitoring year.	0.25 acres	N/A	0	0.00	0.0%
			Cumulative Total	0	0.00	0.0%

Easement Acreage[2] **50.48**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern[4]	Microstegium, tall fescue, multiflora rose, Chinese privet, Chinese lespedeza	1000 SF	Tan Polygons	4	0.14	0.3%
5. Easement Encroachment Areas[3]	Microstegium encroachment	none	N/A	0	0.00	0.0%

1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.

2 = The acreage within the easement boundaries.

3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.

4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by EEP such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in *red italics* are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particulalry for situations where the conditon for an area is somewhere between isolated specimens and dense, discreet patches. In any case, the point or polygon/area feature can be symbolized to describe things like high or low concern and species can be listed as a map inset, in legend items if the number of species are limited or in the narrative section of the executive summary.

database location	\\AE-SBS\RedirectedFolders\pperkinson\Desktop
computer name	PHILLIP-PC
file size	53940224
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
PROJECT SUMMARY	
Project Code	671
project Name	Greenbrier Stream
Sampled Plots	12

Re: Greenbrier Creek Stream Restoration Site
SCO # 0406210-02
Vegetation Warranty Items

Dear Ms. Cheatham:

As stated in the November 8, 2011 letter addressed to you from Ed Hajnos, portions the Greenbrier Creek project site did not meet the vegetation warranty as stated in contract documents. As per SCO contract 0406210-02 Special Provision Section 6.0, bare roots were to be planted at 680 stems per acre, and containerized seedlings at 435 per acre, of those 80% minimum were to survive for one year from Project Acceptance. The warranty period began 2/28/2011 and will expire 2/28/2012.

Field data is summarized below and supplemental information about replant requirements is attached.

Vegetation assessment methodology

Planted vegetation at the Greenbrier Creek site has been assessed once since February 2011 project planting; on September 28, 2011 by the Owner. Data collected during the sampling effort report higher plant mortality than contractually permissible. Warranty replant numbers are based on the data collected. Field methodology and data are described below.

September 28, 2011 sampling

Fourteen (14) vegetation plots were established, each 1,076 sq ft (25m x 4m) in Zone 4 of the original planting plan. All planted bare root and shrubs present within the plot were counted towards the warranty criteria, including those that were top-dead but were re-sprouting at their base. Given 680 stems were planted per acre, 544 per acre were required to survive 1 year, or 13

per plot to meet the 100% warranty. Fourteen (14) sample plots did not meet the survival criteria (Vegetation Warranty Data Map attached).

Zone 4 Data Results

Plot	Living bare roots and shrubs	Required stems per plot	Warranty meet	Supplemental planting density/acre needed to meet warranty
1	4	13	No	364
2	6	13	No	283
3	6	13	No	283
4	2	13	No	445
5	10	13	No	121
6	3	13	No	405
7	10	13	No	121
8	1	13	No	486
9	1	13	No	486
10	12	13	No	40
11	4	13	No	364
12	3	13	No	405
13	3	13	No	405
14	4	13	No	364

Two vegetation plots were established, each 1,076 sq ft (25m x 4m) in Zone 5 of the original planting plan. All containerized seedlings present within the plot were counted towards the warranty criteria, including those that were top-dead but were re-sprouting at their base. Given 435 stems were planted per acre, 348 per acre were required to survive 1-year, or 9 per plot to meet the 100% warranty. Two (2) sample plots did not meet the survival criteria (Vegetation Warranty Data Map attached).

Zone 5 Data Results

Plot	Living bare roots and shrubs	Required stems per plot	Warranty meet	Supplemental planting density/acre needed to meet warranty
1	4	9	No	202
2	7	9	No	81

Supplemental planting

In general, some of plant survival in the Zone 4 and Zone 5 planting zones did not meet the warranty requirement. The table below outlines necessary replanting areas. Surviving stems were subtracted from the warranty criteria (544/acre for Zone 4 and 348 per acre for Zone 5) so that the "Total plants needed" column is the number of remaining stems needed get warranty criteria (544/348) stems per acre in areas with deficient vegetation. Planting densities were averaged into planting zones and are identified on the attached Supplemental Planting Map.

Supplemental Planting Plan

Location (looking downstream)	Planting Zone	Average # stems/ac needed to meet warranty	Acres	Total plants needed
Zone 5 (Unnamed Tributary)	Zone 5	142	0.8	114
Unnamed Tributary (St 400+00 - 407+00) & mainstem (St 106+50 - 100+00)	Zone 4	418	3.0	1,254
Right, mainstem (St 200+00 - 205+50)	Zone 4	263	0.6	158
Left, mainstem (St 200+00 - 206+00)	Zone 4	310	0.7	217
Left, mainstem (St 212+50 - 214+00)	Zone 4	445	0.2	89
Right, mainstem (St 210+50 - 219+00)	Zone 4	121	1	121
		Total	**6.3**	**1,952**

Instructions

- The Supplemental Planting effort needs to be coordinated with EEP so we can arrange with the landowner to be on site.
- All replant materials must conform to the original project specification (dormant season planting, species composition, size, vigor, etc.)
- The Supplemental Planting effort must take place in the dormant season for Alamance County; (December 1 –April 1).
- No planting shall be done when the temperature is below 32^0 F, when the soil to be excavated for the plant hole is frozen, when the sides or bottom o the plant hole are frozen, or when the soil is too wet.

Although the warranty for this project doesn't expire until February 28, 2012, EEP does not intend to reassess the site again for additional warranty compliance. Plants installed during the warranty replant will not have a warranty place on them. Once Carolina Environmental Contracting, Inc. complies with this replanting, a Satisfaction Letter will be awarded.

If you disagree with this finding or have any questions, please contact me directly.

Sincerely,

Kristie Corson

Dear Mrs. Corson,

This letter is to inform you that we were on site February 13, 2012 and February 14, 2012 to install the required plants to satisfy the requirements of the warranty for the project. CEC planted the desired plants per the drawing that was submitted to us by your office.

Sincerely,

Stephen D. James

SUBJECT: June 12, 2007 EEP Nutrient Offset meeting summary

This correspondence is provided to summarize our June 12, 2007 meeting with you, Tom Reeder, Suzanne Klimek, Jim Stanfill and myself. The meeting was held in an attempt to clarify some issues related to EEP's use of riparian buffers to mitigate for Nitrogen and Phosphorus. It is important to come to a common understanding on these issues related to nutrient offset mitigation credit generation as we plan the implementation of mitigation projects. Below are the topics we discussed as they were presented in our May 14, 2007 letter to you. A summary of our discussions is below each topic in italics. We invite your input and response to ensure we have captured our discussions accurately.

1. Riparian Buffer N Reduction Efficiencies: With regard to the January 4, 2007 report detailing your discussions of NO_3-N reduction, we would like to clarify whether the benefits of land use change and the benefit of periodic overbank flooding have been considered in the buffer efficiency calculations. We also want to discuss EEP's buffer widths and the efficiencies that should be used for buffers 100 feet or greater. A 50% efficiency was and is used in our calculations of buffer efficiency for our offset projects. Our projects typically have 200 foot buffer widths.
   The underlying questions here were – Can EEP get more credit for buffers that are wider than 50 feet by using higher efficiency rates as shown in the NLEW paper? As a group we agreed to use an overall efficiency of 50% for riparian buffers used to offset nutrients regardless of width. Rich Gannon noted that although higher efficiencies were suggested in the "NLEW" paper for buffers wider than 50 feet, these numbers are not widely verified. It is therefore appropriate to use 50% to determine reductions. Jim Stanfill agreed noting that EEP buffers are often 200 feet wide and although using a higher efficiency would generate greater mitigation credit, the 50 % number had been used up to this point and EEP would continue to use that to calculate credits.

2. Level Spreaders: The use of level spreaders on riparian buffers not subject to concentrated flow needs to be discussed. It is our understanding that guidance on level spreaders may only be meant to apply to those riparian buffers being used as "onsite" treatment BMPs by permitees. We assume the guidance does not apply to riparian buffer restoration as typically done by EEP, but would like to discuss and get clarification on that issue.
   The standard is to provide diffuse flow through buffers. Because EEP would often need to actually clear portions of riparian buffers to install level spreaders, and also because EEP's buffers are often 200 feet wide, we do not think the use of level spreaders is necessary as long as diffuse flow is maintained. Tom Reeder and Rich Gannon agreed that level spreaders would not necessarily be needed on EEP buffers in rural areas where diffuse flow is not an issue.

3. Land Use Change: If EEP purchases agricultural land to do riparian buffer restoration we believe EEP should get credit for restoration of the entire buffer width. That is, the first 50 feet of buffer would not be excluded from our credit calculations. The argument for this is that while the act of EEP purchasing the property may have changed a property's land use and, therefore, made it subject to the buffer rules, the EEP is actually implementing an active riparian buffer restoration project on that land, not simply taking it out of agricultural use. Furthermore, if EEP does not purchase these lands, there will be no land use change.
Tom and Rich agreed with this statement- EEP should get credit for the entire width restored.

4. We also have some questions about the Jordan nutrient offset trading program, but staff are still reviewing the information that has been released.
EEP will need to provide comments on the Jordan rules to ensure the fees are set appropriately and the requirements (service area) are attainable. This area is likely to have higher implementation costs and less opportunity for lower cost buffers as nutrient offset mitigation. If EEP will accept payments in this area, we must be able to afford to implement projects.

5. EEP's Nutrient Offset Accounting Methods: *Regarding EEP's nutrient offset requirements- Jim Stanfill discussed how we measure the total pounds for 30 years when we accept a nutrient offset payment and take on a requirement. Our projects are set up to offset a total numbers of pounds and, therefore, we may have "shorter" (less than 30 years) more intense projects. Rich and Tom were in agreement with our accounting methods.*

6. Riparian Buffer Mitigation Site location – clarification of intent of rules: *In the Randleman watershed (for Cape Fear 03), EEP staff have questioned where- upstream or downstream- in the watershed the mitigation should take place. Mitigation that EEP already has downstream of the reservoir can be used, but new pursuits should be upstream in order to protect the reservoir. Likewise, in Catawba, new projects should be downstream of Lake James to be used as mitigation credit. EEP staff also clarified that the rules do not have a time requirement for EEP to provide the mitigation, but that the program uses the same time requirements as the MOU. Tom and Rich were also agreeable to this.*

7. *Rich requested that EEP allow for transparencies in its program and asked for us to provide as much data as possible in our annual report and work on information to be included on EEP's Web site. EEP agreed and is working to set up a specific web page at the program's web site devoted to the Nutrient Offset Program.*

Thank you for taking the time to discuss these issues with us. If you need additional information or want to offer corrections or clarifications to the information presented herein, please contact Kelly Williams at (919) 716-1921 or Kelly.williams@ncmail.net.

Sincerely,

Kelly Williams

Subject: Re: EEP Nutrient offset meeting summary

Kelly - I have read the letter and I have no problems with it. It seems to me to be an accurate record of what we discussed and agreed to. Thanks.
