Response to Monitoring Year 5 (2023) DMS Comments
Major Hill Mitigation Site
DMS Project ID No. 100015
Full Delivery Contract No. 7193
USACE Action ID No. SAW-2017-01472
DWR No. 17-0921
RFP No. 16-006990

Comments Received (Black Text) & Responses (Blue Text)

Report & Field Visit

1. Trash such as large metal gate, tires, and concrete were observed along UT-3 which will need to be removed before IRT closeout.
   Response: Surface debris in the Enhancement II area along UT-3 will be removed by hand in Q1 2024. No digging or equipment work will be conducted to avoid disruption to the existing mature riparian buffer.

2. Some privet sprouts (<1 ft) were observed along UT-3 near southern crossing. Please continue treatment. Overall, this site looks great.
   Response: Invasive treatments will continue as needed through closeout.

Digital Comments

1. The submission is missing summary tables 2, 5, 8, 9, 10 included in the report; please submit missing tables. If any photo points were established at the mitigation plan phase in addition to cross sections and vegetation plots, please submit these photos as well. Note that stream survey data should include data labels (ex. LTP, TW) in future submission.
   Response: Tables 1-4 have been added to the "Background Tables" folder in the digital submittal. Tables 5-6 were included in the "Tables" folder of the "Visual Assessment Data" folder in the draft digital submittal and have been included in the final as well. Table 8 was included in the "Veg Plot Data" folder of the draft digital submittal and has been included in the final as well. Tables 9 and 10 were added to the "Veg Plot Data" folder of the final digital submittal. No photo points were established in the mitigation plan other than vegetation plots and cross-sections.

Boundary Inspection

1. Please locate or install the corner monument at platted corners #35 and #41. It is recommended that the culvert position relative to the easement at the south-central portion, near corner #41, be verified.
   Response: A surveyor has been contracted to locate these pins. Work will be completed in Q1 2024.

2. Large debris were observed inside the conservation easement. Items noted were relict fencing debris, metal T-posts, permanent deer stand, bull gate, and wires which will need to be removed before IRT closeout.
   Response: Relict fencing will be removed in Q1 2024, and landowners will be advised regarding deer stand standards. Surface debris in the Enhancement II area along UT-3 will be removed by hand in Q1 2024. No digging or equipment work will be conducted to avoid disruption to the existing mature riparian buffer.

3. Please repair/ locate/ install missing signs at corners and in-line.
   Response: Noted. This will be corrected in Q1 2024.

4. Wooden H-brace that appears to be supporting the active fence at corner #21 and should be moved outside the conservation easement.
   Response: Noted. This will be corrected in Q1 2024.

5. There are several platted non-monumented corners at the crossing in the northwest corner of the site that are difficult to locate. It is recommended that they be marked with posts.
   Response: These non-platted corners are at the stream centerline where the parcel line runs, which is not practical to mark with posts. However, in Q1 2024 we will add marking along the general alignment of the crossing to better identify the corridor.

6. Fence maintenance is recommended at areas where trees have damaged the fence.
   Response: Recommendation noted. RS will continue to work with landowners to ensure fencing where livestock is present is adequate to prevent encroachment.

Major Hill Year 5, 2023 Monitoring Summary

General Notes

- No evidence of nuisance animal activity (i.e., beaver, heavy deer browsing, etc.) was observed.

Streams

- Stream monitoring measurements indicate minimal changes in the cross sections as compared to as-built data. The channel geometry compares favorably with the proposed conditions outlined in the Detailed Restoration Plan and as constructed.

- Across the Site, all in-stream structures are intact and functioning as designed. The channel geometry compares favorably with the proposed conditions outlined in the Detailed Restoration Plan and as constructed. No stream areas of concern were identified during year 5 (2023) monitoring. Stream visual assessment results are documented in Tables 5A-5B (Appendix B). Tables for year 5 (2023) data and annual quantitative assessments are included in Appendix D.

- Two bankfull events were documented during year 5 (2023), resulting in 9 bankfull events to date during the monitoring period (Table 15, Appendix E).

- Channel formation was evident in UT 1 during year 5 (2023). The two streamflow gauges and trail cameras recorded 233 and 249 consecutive streamflow days (Tables 14A-B, Appendix E).

- Benthic macroinvertebrate sampled data during MY 5 shows increases in richness and diversity when compared to preconstruction surveys. When compared to reference site data, the onsite data is only slightly below reference values for MY 5. Results and habitat forms are included in Appendix F.

Wetlands

- All six groundwater gauges met success for the Year 5 (2023) monitoring period. Wetland hydrology data is in Appendix E.

Gauge	Success Criteria Achieved/Max Consecutive Days During Growing Season (Percentage)						
	Year 1 (2019)	Year 2 (2020)	Year 3 (2021)	Year 4 (2022)	Year 5 (2023)	Year 6 (2024)	Year 7 (2025)
1	No/14 days* 6.0 percent	Yes/136 days 57.9 percent	Yes/74 days 31.4 percent	Yes/93 days 39.4 percent	Yes/95 days 40.3 percent		
2	No/19 days* 8.1 percent	No/19 days 8.0 percent	No/21 days 8.9 percent	Yes/44 days 18.6 percent	Yes/50 days 21.3 percent		
3	Yes/25 days 10.6 percent	Yes/235 days 100 percent	Yes/226 days 95.8 percent	Yes/204 days 86.4 percent	Yes/190 days 80.9 percent		
4	Yes/34 days 14.5 percent	Yes/72 days 30.5 percent	Yes/60 days 25.4 percent	Yes/155 days 65.7 percent	Yes/85 days 36.2 percent		
5	Yes/119 days 50.6 percent	Yes/135 days 57.4 percent	Yes/53 days 22.5 percent	Yes/77 days 32.6 percent	Yes/51 days 21.7 percent		
6	Yes/77 days 32.8 percent	Yes/44 days 18.7 percent	Yes/80 days 33.9 percent	Yes/81 days 34.3 percent	Yes/100 days 42.6 percent		

Vegetation

- Measurements of the 8 permanent vegetation plots resulted in an average of 354 planted stems/acre excluding livestakes. Seven out of 8 plots met success criteria. Additionally, two temporary vegetation transects met success criteria resulting in a sitewide average of 547 stems/acre, including natural recruits. Lastly, stem height data from the 8 permanent vegetation plots indicates a Site average of 7.29 feet, which meets the 7-foot height criteria required at Year 5. Year 5 (2023) vegetation data is included in Tables 8-10 (Appendix C).

MY 5 (2023) Monitoring Activity and Reporting History

Activity or Deliverable	Data Collection Complete	Completion or Delivery
MY 5 (2023) Vegetation Data Collection	August 25, 2023	--
MY 5 (2023) Stream Data Collection	May 16, 2023	--
MY 5 (2023) Monitoring Report	October 2023	February 2024

Site Maintenance Report (2023)

Invasive Species Work	Maintenance work
05/17/2023 Privet, Russian Olive, Nodding Thistle, Multiflora rose 09/13/23 Privet, Russian Olive, Multiflora rose, Tree-of-heaven	06/14/2023, 06/21/2023, 09/27/2023, and 09/28/2023 Old fence within easement removal and boundary inspections. 12/02/2023 Fence relocation 12/05/2023 Supplemental planting

Boundary Inspection

- During the NC DMS boundary inspection with Danielle Mir and Jeff Horton on September 21, 20223, multiple issues were discovered. No conservation easement placards were visible across the entire property. One section of fence located at easement corner 1 was constructed +/-18 inches within the easement, see on Figure 3 (Appendix H). Easement corner 1 appeared to be improperly stamped. One stamped easement cap was not located at easement corner 2, see Figure 3 (Appendix H.)
    - Resolutions:
      On September 27th, 2023, RS staff members performed a comprehensive boundary inspection. While performing the inspection, conservation easement placards were installed at each corner of the easement, see Photo Log (Appendix H.) The section of fence constructed inside the easement is determined to remain in place due to property boundary constraints and large hardwood trees in line with the easement boundary, see NC DMS Email Response (Appendix H). Easement corner 1 is stamped appropriately according to the NC DEQ Guidance, see Easement Inspection Photo Log

(Appendix H). Easement corner 2 is a property corner and has an existing iron pipe marking property lines, see Map of Record (Appendix H).

- On September 27, 2023, while performing the easement inspection, RS staff members discovered an encroachment area measuring 0.04 acres on the Site's south side shown on Figure 2 (Appendix B). An existing cattle fence was not relocated to boundary corners during construction. No other encroachments were documented during the inspection.
    - Resolutions:
      On December 02, 2023, the fence was relocated outside the easement. On December 05, 2023, a supplemental planting of twenty 3-gallon pots consisting of mitigation plan approved species, including 5 Black gum (*Nyssa Sylvatica),* 5 Water Oak (*Quercus nigra*), and 10 Willow Oak (*Quercus phellos)* were planted within the encroached area, see Photo Log (Appendix H).

TABLE OF CONTENTS

APPENDICES

1.0 PROJECT SUMMARY

Restoration Systems, LLC has established the North Carolina Division of Mitigation Services (NCDMS) Major Hill Stream and Wetland Restoration Site (Site).

1.1 Project Goals & Objectives

Project goals are based on the *Cape Fear River Basin Restoration Priorities* (RBRP) report (NCEEP 2009) and on-site data collection of channel morphology and function observed during field investigations. The Site is located within Targeted Local Watershed (TLW) 03030002050050. The RBRP report documents benthic ratings vary between "Fair" and "Good-Fair" possibly due to cattle, dairy, and poultry operations. The project is not located in a Regional or Local Watershed Planning Area; however, RBRP goals are addressed by project activities as follows with Site specific information following the RBRP goals in parenthesis.

1. Reduce and control sediment inputs (reduction of 10.0 tons/year after mitigation is complete);
2. Reduce and manage nutrient inputs (livestock removal from streams, elimination of fertilizer application, and marsh treatment areas may result in a direct reduction of 852.4 pounds of nitrogen and 70.6 pounds of phosphorus per year);
3. Protect and augment designated natural heritage areas.

Site-specific mitigation goals and objectives were developed through the use of the North Carolina Stream Assessment Method (NC SAM) and North Carolina Wetland Assessment Method (NC WAM) analyses of existing and reference stream systems at the Site (NC SFAT 2015 and NC WFAT 2010).

Stream/Wetland Targeted Functions, Goals, and Objectives

Targeted Functions	Goals	Objectives	Compatibility of Success Criteria
(1) HYDROLOGY			
(2) Flood Flow (Floodplain Access) (3) Streamside Area Attenuation (4) Wooded Riparian Buffer (4) Microtopography	• Attenuate flood flow across the Site. • Minimize downstream flooding to the maximum extent possible. • Connect streams to functioning wetland systems.	• Construct new channel at historic floodplain elevation to restore overbank flows and restore jurisdictional wetlands • Plant woody riparian buffer • Remove livestock • Deep rip floodplain soils to reduce compaction and increase soil surface roughness • Protect riparian buffers with a perpetual conservation easement	• BHR not to exceed 1.2 • Document four overbank events in separate monitoring years • Livestock excluded from the easement • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria • Conservation Easement recorded

Stream/Wetland Targeted Functions, Goals, and Objectives (Continued)

Targeted Functions	Goals	Objectives	Compatibility of Success Criteria
(1) HYDROLOGY (Continued)			
(3) Stream Stability (4) Channel Stability (4) Sediment Transport	• Increase stream stability within the Site so that channels are neither aggrading nor degrading.	• Construct channels with proper pattern, dimension, and longitudinal profile • Remove livestock • Construct stable channels with cobble/gravel substrate • Plant woody riparian buffer •	• Cross-section measurements indicate a stable channel with cobble/gravel substrate • Visual documentation of stable channels and structures • BHR not to exceed 1.2 • ER of 1.4 or greater • < 10% change in BHR and ER in any given year • Livestock excluded from the easement • Attain Vegetation Success Criteria
(1) WATER QUALITY			
(2) Streamside Area Vegetation (3) Upland Pollutant Filtration (3) Thermoregulation (2) Indicators of Stressors	• Remove direct nutrient and pollutant inputs from the Site and reduce contributions to downstream waters.	• Remove livestock and reduce agricultural land/inputs • Install marsh treatment areas • Plant woody riparian buffer • Restore/enhance jurisdictional wetlands adjacent to Site streams	• Livestock excluded from the easement • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria
(1) HABITAT			
(2) In-stream Habitat (3) Substrate (3) Stream Stability (3) In-Stream Habitat (2) Streamside Habitat (3) Streamside Habitat (3) Thermoregulation Wetland Landscape Patch Structure Wetland Vegetation Composition	• Improve instream and streamside habitat.	• Construct stable channels with cobble/gravel substrate • Plant woody riparian buffer to provide organic matter and shade • Construct new channel at historic floodplain elevation to restore overbank flows and plant woody riparian buffer • Protect riparian buffers with a perpetual conservation easement • Restore/enhance jurisdictional wetlands adjacent to Site streams	• Cross-section measurement indicate a stable channel with cobble/gravel substrate • Visual documentation of stable channels and in-stream structures. • Attain Wetland Hydrology Success Criteria • Attain Vegetation Success Criteria • Conservation Easement recorded

1.2 Project Background

The Major Hill Stream and Wetland Mitigation Site (hereafter referred to as the "Site") encompasses 16.7 acres along warm water, unnamed tributaries to Pine Hill Branch. The Site is located approximately 3.5 miles southeast of Snow Camp and 6 miles north of Silk Hope in southern Alamance County near the Chatham County line (Figure 1, Appendix B).

Before construction, Site land use consisted of disturbed forest and agricultural land used for livestock grazing and hay production. Livestock had unrestricted access to Site streams, which had been relocated to the floodplain edge, ditched, impounded, trampled by livestock, eroded vertically and laterally, and received extensive sediment and nutrient inputs from stream banks and adjacent pastures. Approximately 60 percent of the stream channel was degraded, contributing to sediment export from the Site resulting from mechanical processes such as livestock hoof shear. In addition, streamside wetlands were cleared and drained by channel downcutting and land uses. Preconstruction Site conditions resulted in degraded water quality, a loss of aquatic habitat, reduced nutrient and sediment retention, and unstable channel characteristics (loss of horizontal flow vectors that maintain pools and an increase in erosive forces to channel bed and banks). Site restoration activities restored riffle-pool morphology aiding in energy dissipation, increased aquatic habitat, stabilized channel banks, and will greatly reduce sediment loss from channel banks.

1.3 Project Components and Structure

Site restoration activities generated 3058 Stream Mitigation Units (SMUs) and 0.76 Wetland Mitigation Units (WMUs) as the result of the following:

- 1738 linear feet of Priority I stream restoration
- 3299 linear feet of stream enhancement (Level II)
- 0.54 acre of riparian wetland restoration
- 0.44 acre of riparian wetland enhancement

Additional activities that occurred at the Site included the following.

- Installation of a marsh treatment area to treat drainage prior to entering UT1.
- Fencing the entire conservation easement by leaving some pre-existing fencing, removing fencing, and installing additional fencing.
- Planting 8.11 acres of the Site with 8600 stems (planted species and densities by zone are included in Table 7 [Appendix C]).
- Removing a small, abandoned farm pond by 1) notching the dam to dewater; 2) removal of the dam to the elevation of the adjacent floodplain; 3) excavating sediment that was unsuitable for channel bank construction; 4) backfilling areas of sediment removed with soil suitable for channel construction (as necessary); 5) excavation of the design channel, 6) stabilization of the channel with coir matting, seed, and mulch; and 7) installation of structures.

Site design was completed in February 2018. Construction started on July 25, 2018 and ended within a final walkthrough on September 6, 2018. The Site was planted in December 2018-January 2019. Completed project activities, reporting history, completion dates, project contacts, and background information are summarized in Tables 1-4 (Appendix A).

1.4 Success Criteria

Project success criteria have been established per the October 24, 2016, NC Interagency Review Team *Wilmington District Stream and Wetland Compensatory Mitigation Update*.

1.4.1 Stream Success Criteria

From a mitigation perspective, several goals and objectives are assumed to be functionally elevated by restoration activities without direct measurement. Other goals and objectives will be considered successful upon achieving vegetation success criteria. The following summarizes stream success criteria.

- All streams must maintain an Ordinary High-Water Mark (OHWM), per RGL 05-05.
- Continuous surface flow must be documented each year for at least 30 consecutive days.
- Bank height ratio (BHR) cannot exceed 1.2 at any measured cross-section.
- Entrenchment ratio (ER) must be no less than 1.4 at any measured riffle cross-section.
- BHR and ER at any measure riffle cross-section should not change by more than 10% from baseline condition during any given monitoring period.
- The stream project shall remain stable and all other performance standards shall be met through four separate bankfull events, occurring in separate years, during the monitoring years 1-7.

1.4.2 Wetland Success Criteria

The following summarizes wetland success criteria.

- Saturation or inundation within the upper 12 inches of the soil surface for, at a minimum, 10 percent of the growing season during average climatic conditions

According to the *Soil Survey of Alamance County*, the growing season for Alamance County is from April 17 – October 22 (USDA 1960). However, the start date for the growing season is not typical for the Piedmont region; therefore, for this project, hydrologic success will be determined using data from March 1 - October 22 to represent the period of biological activity more accurately. Based on growing season information outlined in the *Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region* (USACE 2010), this will be confirmed annually by soil temperatures exceeding 41 degrees Fahrenheit at 12 inches depth and/or bud burst.

Target hydrological characteristics include saturation or inundation for 10 percent of the monitored period (March 1-October 22) during average climatic conditions. During years with atypical climatic conditions, groundwater gauges in reference wetlands may be used for comparison to the Site; however, reference gauge data will not be tied to success criteria. These areas are expected to support hydrophytic vegetation. A jurisdictional determination will be performed if wetland parameters are marginal as indicated by vegetation and/or hydrology monitoring. The jurisdictional determination will not supersede monitoring data or overturn a failure in meeting success criteria; however, this information may be used by the IRT, at the discretion of the IRT, to make a final determination on Site wetland re-establishment success.

1.4.3 Vegetation Success Criteria

The following summarizes vegetation success criteria.

- Within planted portions of the Site, a minimum of 320 stems per acre must be present at year 3; and a minimum of 210 stems per acre must be present at year 7.
- Trees must average 7 feet in height at year 5, and 10 feet in height at year 7.
- Planted and volunteer stems are counted, provided they are included in the approved planting list for the Site; natural recruits not on the planting list may be considered by the IRT on a case-by-case basis.
- Any single species can only account for 50% of the required stems within any vegetation plot.

2.0 METHODS

Monitoring requirements and success criteria outlined in this plan follow the October 24, 2016 NC Interagency Review Team *Wilmington District Stream and Wetland Compensatory Mitigation Update*. Monitoring will be conducted by Axiom Environmental, Inc. Annual monitoring reports of the data collected will be submitted to the NCDMS by Restoration Systems no later than December 31 of each monitoring year data is collected. The monitoring schedule is summarized in the following table.

Monitoring Schedule

Resource	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7
Streams	X	X	X		X		X
Wetlands	X	X	X	X	X	X	X
Vegetation	X	X	X		X		X
Macroinvertebrates			X		X		X
Water Quality	X	X	X	X	X	X	X
Visual Assessment	X	X	X	X	X	X	X
Report Submittal	X	X	X	X	X	X	X

2.1 Stream Monitoring

Annual monitoring will include development of channel cross-sections and substrate on riffles and pools (Figure 2, Appendix B). Data presented in graphic and tabular format include 1) cross-sectional area, 2) bankfull width, 3) average depth, 4) maximum depth, and 5) width-to-depth ratio. Longitudinal profiles were monitored for as-built; however, profiles will not be measured unless monitoring demonstrates channel bank or bed instability. In this case, longitudinal profiles may be required by the USACE along reaches of concern to track changes and demonstrate stability.

Stream Monitoring Summary

Parameter	Method	Schedule/Frequency	Number/Extent
Stream Profile	Full longitudinal survey	As-built (unless otherwise required)	All restored stream channels
Stream Dimension	Cross-sections	Years 1, 2, 3, 5, and 7	10 cross-sections
Channel Stability	Visual Assessments	Yearly	All restored stream channels
	Bank Pins	Yearly	Only if instability is documented during monitoring
	Additional Cross-sections	Yearly	Only if instability is documented during monitoring
Stream Hydrology	Continuous monitoring water level gauges and/or trail camera	Continuous recording through monitoring period	Two gauges on UT1 (upstream and downstream) and one trail camera on UT1 (downstream)
Water Quality	Water samples	Yearly	Two locations
Macroinvertebrates	Qual 4 sampling	Years 3, 5, and 7	Two locations

All streams are functioning as designed, and no stream areas of concern were observed during year 5 (2023) monitoring. Stream morphology and water quality data is available in Appendix D, and benthic macroinvertebrate data is in Appendix F.

Benthic macroinvertebrate sampled data during MY 5 shows increases in richness and diversity when compared to preconstruction surveys. When compared to reference site data, the onsite data is only slightly below reference values for MY 5. Results and habitat forms are included in Appendix F.

2.2 Wetland Monitoring

Six groundwater monitoring gauges were installed within the drained pond area and the remaining wetland restoration areas to take measurements after hydrological modifications were performed at the Site (Figure 2, Appendix B). Hydrological sampling will continue throughout the entire year at intervals necessary to satisfy jurisdictional hydrology success criteria. In addition, an on-site rain gauge will document rainfall data for comparison of groundwater conditions with extended drought conditions, and a trail camera was installed to confirm overbank flooding events. Growing season soil temperatures will also be documented using a continuously logging soil temperature probe, this data will be provided with wetland hydrology data (Appendix E).

Wetland Monitoring Summary

Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected
Wetland Restoration	Groundwater gauges	As-built, Years 1, 2, 3, 4, 5, 6, and 7	6 gauges spread throughout restored wetlands	Soil temperature at the beginning of each monitoring period, groundwater and rain data for each monitoring period

Summary of Monitoring Period/Hydrology Success Criteria by Year

Year	Soil Temperatures/Date Bud Burst Documented	Monitoring Period Used for Determining Success	10 Percent of Monitoring Period
2019 (Year 1)	March 1, 2019	March 1-October 22 (236 days)	24 Days
2020 (Year 2)	March 1, 2020	March 1-October 22 (236 days)	24 Days
2021 (Year 3)	March 1, 2021	March 1- October 22 (236 days)	24 Days
2022 (Year 4)	March 1, 2022	March 1- October 22 (236 days)	24 Days
2022 (Year 5)	March 1, 2023*	March 1- October 22 (236 days)	24 Days

*An on-site soil temperature data logger installed 12 inches below the ground surface read 54.08°F on March 1, and the soil temperature remained well-above 41°F thereafter. Additionally, bud bursts were documented on February 28.

All six groundwater gauges met success criteria for the year 5 (2023) monitoring period. Year 5 (2023) groundwater gauge data and graphs are located in Appendix E.

2.3 Vegetation Monitoring

Planting occurred in December 2018-January 2019 within 8.11 acres of the Site and included 8600 stems. After planting was completed, an initial evaluation was performed to verify planting methods and to determine initial species composition and density.

In early January 2020, a winter-time visual assessment of the Site was performed, and it was determined that although Year 1 (2019) vegetation data, including random transects, showed a high density of trees, a light supplemental planting would help ensure the long-term success in several areas. On January 31, 2020, three areas that visually exhibited low stem density and/or poor vigor were supplementally planted (Figure 2, Appendix B). During the supplemental planting effort, 370 stems were planted across 1.20 acres (approximately 300 stems per acre). As the planting was designated for visual purposes and was not an effort to increase stem density data, no stems were planted within permanent vegetation plots.

Preparation included the application of 100 lbs of lime, 50 lbs of fertilizer, and 3 lbs of seed to stabilize bare areas. The following table lists species included in the supplemental planting list.

2020 Supplemental Planting Species List

Species	Number of Stems
Tag Alder (*Alnus serrulata*)@	20
Chinkapin (*Castanea pumila*)@	20
Hackberry (*Celtis occidentalis*)%	50
Hawthorn (*Crataegus marshallii*)@	20
Crab Apple (*Malus angustifolia*)@	50
Red Mulberry (*Morus rubra*)@	100
Sycamore (*Platanus occidentalis*)*	50
Shumard Oak (*Quercus shumardii*)@	50
Total	**370**

* Included in mitigation plan planting list

% Not included in mitigation plan planting list but meets target community

@ Species selected based on lack of availability of mitigation plan planting list and target community species

In addition, three random vegetation transects (MY2 2020 Random Vegetation Transects) were measured after planting was complete to determine that those areas met the required stem densities; results indicated a range of stems per acre of 364 to 1012.

An assessment was made during early Fall 2018 to treat fescue within the Dry-Mesic Oak Hickory Forest planting zones to reduce competition with planted stems. Treatment was conducted in December 2018. Treatments of invasive plant species continued during 2019 throughout the Site. Japanese Stiltgrass and Tree-of-Heaven were high priorities during the 2019 invasive treatment season. Restoration Systems will continue to treat and monitor the Site for invasive species throughout the monitoring period.

Site Maintenance Report (2023)

Invasive Species Work	Maintenance work
05/17/2023 Privet, Russian Olive, Nodding Thistle, Multiflora rose 09/13/23 Privet, Russian Olive, Multiflora rose, Tree-of-heaven	06/14/2023, 06/21/2023, 09/27/2023, and 09/28/2023 Old fence within easement removal and boundary inspections. 12/02/2023 Fence relocation 12/05/2023 Supplemental planting

2023 Planned Vegetation Maintenance

Restoration Systems continues to monitor fescue throughout the Site. Based on permanent and random vegetation monitoring plots and visual observations, planted stems are established within areas where fescue was a concern.

On September 27, 2023, while performing the easement inspection, members discovered an encroachment area measuring .04 acres on the site's south side shown on Figure 2 (Appendix B). An existing cattle fence was not relocated to boundary corners during construction. No other encroachments were documented during the inspection. On December 02, 2023, the fence was relocated outside the easement. On December 05, 2023, a supplemental planting of twenty 3-gallon pots consisting of mitigation plan approved species, including 5 Black gum (*Nyssa Sylvatica),* 5 Water Oak (*Quercus nigra*), and 10 Willow Oak (*Quercus phellos)* were planted within the encroached area, see Photo Log (Appendix H).

Vegetation Monitoring Summary

Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected
Vegetation establishment and vigor	Permanent vegetation plots 0.0247 acre (100 square meters) in size	As-built, Years 1, 2, 3, 5, and 7	8 plots spread across the Site	Species, height, location, planted vs. volunteer, and age
	Random vegetation plots, 0.0247 acre (100 square meters) in size	As-built, Years 1, 2, 3, 5, and 7	2 plots randomly selected each year	Species and height

During quantitative vegetation sampling, 8 sample plots (10-meter by 10-meter) were installed within the Site as per guidelines established in *CVS-EEP Protocol for Recording Vegetation*, *Version 4.2* (Lee et al. 2008). Measurement also included two random sample plots (50-meter by 2-meter). Measurements of the 8 permanent vegetation plots resulted in an average of 354 planted stems/acre excluding livestakes. All plots met the stem density success criteria based on planted stems alone except for permanent plots 1 and 4; however, when including naturally recruited stems of green ash (*Fraxinus pennsylvanica*), plot 1 met the stem density success criteria. Additionally, both temporary vegetation transects met the stem density success criteria resulting in a sitewide average of 547 stems/acre, including natural recruits. Lastly, stem height data from the 8 permanent vegetation plots indicates a Site average of 7.29 feet, which meets the 7-foot height criteria required at Year 5. Year 5 (2023) vegetation data is included in Tables 8-10 (Appendix C).

Project Information			
Project Name	Major Hill Restoration Site		
Project County	Alamance County, North Carolina		
Project Area (acres)	16.7		
Project Coordinates (latitude & latitude)	35.873206, -79.360906		
Planted Area (acres)	8.11		
Project Watershed Summary Information			
Physiographic Province	Piedmont		
Project River Basin	Cape Fear		
USGS HUC for Project (14-digit)	03030002050050		
NCDWR Sub-basin for Project	03-06-04		
Project Drainage Area (acres)	17 to 445		
Percentage of Project Drainage Area that is Impervious	<2%		
CGIA Land Use Classification	Managed Herbaceous Cover & Mixed Upland Hardwoods		
Reach Summary Information			
Parameters	**UT 1**	**UT 2**	**UT 3**
Length of reach (linear feet)	2796	207	2298
Valley Classification & Confinement	Alluvial, moderately confined to confined		
Drainage Area (acres)	71.7	17.2	444.7
NCDWR Stream ID Score	20.25 – 33.5	--	--
Perennial, Intermittent, Ephemeral	Intermittent/Perennial	Intermittent	Perennial
NCDWR Water Quality Classification	WS-V, NSW		
Existing Morphological Description (Rosgen 1996)	Cg5	C4/5	C3
Proposed Stream Classification (Rosgen 1996)	C/E 4	C4/5	C3
Existing Evolutionary Stage (Simon and Hupp 1986)	III/IV	III	I
Underlying Mapped Soils	Efland silt loam, Georgeville silt loam, Herndon silt loam, Orange silt loam, Worsham sandy loam, Local Alluvial Land		
Drainage Class	Well-drained, well-drained, well-drained, poorly drained, well-drained, poorly drained, respectively		
Hydric Soil Status	Nonhydric, nonhydric, nonhydric, nonhydric, hydric, hydric, respectively		
Slope	0.0241	0.0256	0.0130
FEMA Classification	NA		
Native Vegetation Community	Piedmont Alluvial Forest/Dry-Mesic Oak-Hickory Forest		
Watershed Land Use/Land Cover (Site)	45% forest, 35% agricultural land, 20% low density residential/impervious surface		
Watershed Land Use/Land Cover (Cedarock Reference Channel)	65% forest, 30% agricultural land, <5% low density residential/impervious surface		
Percent Composition of Exotic Invasive Vegetation	<5%		

Table 4. Project Attribute Table - Major Hill Restoration Site (Continued)

Wetland Summary Information	
Parameters	**Wetlands**
Wetland acreage	0.54 acre drained or impounded & 0.44 acre degraded
Wetland Type	Riparian riverine
Mapped Soil Series	Worsham and Local Alluvial Land
Drainage Class	Poorly drained
Hydric Soil Status	Hydric
Source of Hydrology	Groundwater, stream overbank
Hydrologic Impairment	Incised streams, compacted soils, livestock
Native Vegetation Community	Piedmont/Low Mountain Alluvial Forest
% Composition of Exotic Invasive Vegetation	<5%
Restoration Method	Hydrologic, vegetative
Enhancement Method	Vegetative

Table 6 Vegetation Condition Assessment

Major Hill

Planted Acreage[1] **8.1**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	None	0.1 acres	none	0	0.00	0.0%
2. Low Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
2B. Low Planted Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
			Total	0	0.00	0.0%
3. Areas of Poor Growth Rates or Vigor	None	0.25 acres	none	0	0.00	0.0%
			Cumulative Total	0	0.00	0.0%

Easement Acreage[2] **16.7**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern[4]	None	1000 SF	none	0	0.00	0.0%
5. Easement Encroachment Areas[3]	None	none	pink crosshatch	1	0.04	0.2%

1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.

2 = The acreage within the easement boundaries.

3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.

4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by DMS such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in *red italics* are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particulalry for situations where the conditon for an area is somewhere between isolated specimens and dense, discreet patches. In any case, the point or polygon/area feature can be symbolized to describe things like high or low concern and species can be listed as a map inset, in legend items if the number of species are limited or in the narrative section of the executive summary.

Table 15. Verification of Bankfull Events

Date of Data Collection	Date of Occurrence	Method	Photo (if available)
March 19, 2019	January 13, 2019	A trail camera captured the stream at bankfull after 1.10 inches of rain was documented on January 13, 2019 at an on-site rain gauge.	1
March 19, 2019	February 23, 2019	A trail camera captured the stream at bankfull after 2.74 inches of rain was documented between February 22-23, 2019 at an on-site rain gauge.	2
June 27, 2019	April 13, 2019	Stream gauge data indicates a bankfull event occurred after 4.11 inches of rain was documented between April 12-13, 2019 at an on-site rain gauge.	--
September 9, 2019	July 24, 2019	A bankfull event likely occurred after 3.02 inches of rain was documented between July 23-24, 2019 at an on-site rain gauge.	--
September 9, 2019	August 1, 2019	A bankfull event likely occurred after 1.96 inches of rain was documented on August 1, 2019 at an on-site rain gauge.	--
April 13, 2020	April 13, 2020	A bankfull event was documented via trail camera after approximately 2.31 inches of rain was recorded at an on-site rain gauge	3
January 31, 2021	January 31, 2021	A bankfull event was documented via trail camera after approximately 1.19 inches of rain was recorded at an on-site rain gauge	4
March 11, 2021	February 15, 2021	Wrack and laid-back vegetation were observed along the top of bank and floodplain of UT-1 indicating a bankfull event occurred after 2.93 inches of rain was documented between February 11 and 15, 2021.	5
March 16, 2022	March 16, 2022	A trail camera captured the stream at bankfull after 1.47 inches of rain was documented on March 16, 2022 at an on-site rain gauge.	6
August 2, 2022	July 27, 2022	Wrack piles were observed along the top of bank and floodplain of UT-1 indicating a bankfull event occurred after 1.73 inches of rain was documented on July 27, 2022.	7
February 12, 2023	February 12, 2023	A bankfull event was documented via trail camera after approximately 1.63 inches of rain was recorded at an on-site rain gauge.	8
April 7, 2023	April 7, 2023	A bankfull event was documented via trail camera after approximately 1.19 inches of rain was recorded at an on-site rain gauge.	9
June 19, 2023	June 19, 2023	A bankfull event was documented via trail camera after approximately 2.95 inches of rain was recorded at an on-site rain gauge.	10

MH - 17-009

Habitat Assessment Field Data Sheet
Mountain/ Piedmont Streams

Biological Assessment Unit, DWQ

TOTAL SCORE 85

Directions for use: The observer is to survey a **minimum of 100 meters with 200 meters preferred** of stream, preferably in an **upstream** direction starting above the bridge pool and the road right-of-way. The segment which is assessed should represent average stream conditions. To perform a proper habitat evaluation the observer needs to get into the stream. To complete the form, select the description which best fits the observed habitats and then circle the score. If the observed habitat falls in between two descriptions, select an intermediate score. A final habitat score is determined by adding the results from the different metrics.

Stream MH-UT1d Location/road: Graham (Road Name Burwell Church)County Alamance

Date 6/13/23 CC# 03030002 Basin Cape Fear Subbasin 03-06-04

Observer(s) PP LB Type of Study: ☐ Fish ☒Benthos ☐ Basinwide ☐Special Study (Describe) ______

Latitude 36.073213 Longitude -79.358804 Ecoregion: ☐ MT ☒ P ☒ Slate Belt ☐ Triassic Basin

Water Quality: Temperature ______ ^{0}C DO ______ mg/l Conductivity (corr.) ______ µS/cm pH ______

Physical Characterization: Visible land use refers to immediate area that you can see from sampling location - include what you estimate driving thru the watershed in watershed land use.

Visible Land Use: 60 %Forest ______ %Residential 40 %Active Pasture ______ % Active Crops
______ %Fallow Fields ______ % Commercial ______ %Industrial ______ %Other - Describe: ______

Watershed land use : ☒Forest ☐Agriculture ☐Urban ☐ Animal operations upstream

Width: (meters) Stream 2-4 Channel (at top of bank) 3-4 **Stream Depth:** (m) Avg .01 Max .1
☐ Width variable ☐ Large river >25m wide

Bank Height (from deepest part of riffle to top of bank-first flat surface you stand on): (m) .5-1

Bank Angle: 90-100 ° or ☐ NA (Vertical is 90°, horizontal is 0°. Angles > 90° indicate slope is towards mid-channel, < 90° indicate slope is away from channel. NA if bank is too low for bank angle to matter.)

☐ Channelized Ditch
☐Deeply incised-steep, straight banks ☐Both banks undercut at bend ☐Channel filled in with sediment
☐ Recent overbank deposits ☐Bar development ☐Buried structures ☐Exposed bedrock
☐ Excessive periphyton growth ☐ Heavy filamentous algae growth ☐Green tinge ☐ Sewage smell

Manmade Stabilization: ☒N ☐Y: ☐Rip-rap, cement, gabions ☐ Sediment/grade-control structure ☐Berm/levee

Flow conditions : ☐High ☐Normal ☒Low

Turbidity: ☐Clear ☐ Slightly Turbid ☐Turbid ☐Tannic ☐Milky ☐Colored (from dyes)

Good potential for Wetlands Restoration Project?? ☐ YES ☒NO **Details** - restored/enhancement

Channel Flow Status

Useful especially under abnormal or low flow conditions.

A. Water reaches base of both lower banks, minimal channel substrate exposed .... ☐
B. Water fills >75% of available channel, or <25% of channel substrate is exposed............ ☐
C. Water fills 25-75% of available channel, many logs/snags exposed............ ☒
D. Root mats out of water............ ☐
E. Very little water in channel, mostly present as standing pools............ ☐

Weather Conditions: no rain 48-5 **Photos:** ☒N ☐Y ☐ Digital ☐35mm

Remarks: Cattle have been removed from riparian area
some open pasture upstream

Lots of salamanders + spiders -
few crayfish

"HT1D

I. Channel Modification

	Score
A. channel natural, frequent bends	5
B. channel natural, infrequent bends (channelization could be old)	(4)
C. some channelization present	3
D. more extensive channelization, >40% of stream disrupted	2
E. no bends, completely channelized or rip rapped or gabioned, etc	0

☐ Evidence of dredging ☐Evidence of desnagging=no large woody debris in stream ☐Banks of uniform shape/height

Remarks_____ Subtotal 4

II. Instream Habitat: Consider the percentage of the reach that is favorable for benthos colonization or fish cover. If >70% of the reach is rocks, 1 type is present, circle the score of 17. Definition: leafpacks consist of older leaves that are packed together and have begun to decay (not piles of leaves in pool areas). Mark as Rare, Common, or Abundant.

__(C)__**Rocks** ____**Macrophytes** __C__**Sticks and leafpacks** ____**Snags and logs** ____**Undercut banks or root mats**

AMOUNT OF REACH FAVORABLE FOR COLONIZATION OR COVER

	>70% Score	40-70% Score	20-40% Score	<20% Score
4 or 5 types present	20	16	12	8
3 types present	19	15	11	7
2 types present	18	(14)	10	6
1 type present	17	13	9	5
No types present	0			

☐ No woody vegetation in riparian zone Remarks_____ Subtotal 14

III. Bottom Substrate (silt, sand, detritus, gravel, cobble, boulder) Look at entire reach for substrate scoring, but only look at riffle for embeddedness, and use rocks from all parts of riffle-look for "mud line" or difficulty extracting rocks.

	Score
A. substrate with good mix of gravel, cobble and boulders	
1. embeddedness <20% (very little sand, usually only behind large boulders)	15
2. embeddedness 20-40%	12
3. embeddedness 40-80%	8
4. embeddedness >80%	3
B. substrate gravel and cobble	
1. embeddedness <20%	14
2. embeddedness 20-40%	(11)
3. embeddedness 40-80%	6
4. embeddedness >80%	2
C. substrate mostly gravel	
1. embeddedness <50%	8
2. embeddedness >50%	4
D. substrate homogeneous	
1. substrate nearly all bedrock	3
2. substrate nearly all sand	3
3. substrate nearly all detritus	2
4. substrate nearly all silt/ clay	1

Remarks_____ Subtotal 11

IV. Pool Variety Pools are areas of deeper than average maximum depths with little or no surface turbulence. Water velocities associated with pools are always slow. Pools may take the form of "pocket water", small pools behind boulders or obstructions, in large high gradient streams, or side eddies.

	Score
A. Pools present	
1. Pools Frequent (>30% of 200m area surveyed)	
a. variety of pool sizes	10
b. pools about the same size (indicates pools filling in)	8
2. Pools Infrequent (<30% of the 200m area surveyed)	
a. variety of pool sizes	(6)
b. pools about the same size	4
B. Pools absent	0

Subtotal 6

☒ Pool bottom boulder-cobble=hard ☐ Bottom sandy-sink as you walk ☐ Silt bottom ☐ Some pools over wader depth

Remarks_____

Page Total 35

UT1D

V. Riffle Habitats

Definition: Riffle is area of reaeration-can be debris dam, or narrow channel area.

	Riffles **Frequent** Score	Riffles **Infrequent** Score
A. well defined riffle and run, riffle as wide as stream and extends 2X width of stream....	(16)	12
B. riffle as wide as stream but riffle length is not 2X stream width	14	7
C. riffle not as wide as stream and riffle length is not 2X stream width	10	3
D. riffles absent.....	0	

Channel Slope: ☐Typical for area ☐Steep=fast flow ☐Low=like a coastal stream Subtotal 16

VI. Bank Stability and Vegetation

FACE UPSTREAM	Left Bank Score	Rt. Bank Score
A. Banks stable		
1. little evidence of erosion or bank failure(except outside of bends), little potential for erosion..	(5)	(7)
B. Erosion areas present		
1. diverse **trees**, shrubs, grass; plants healthy with good root systems.....	6	6
2. few trees or small trees and **shrubs**; vegetation appears generally healthy.....	5	5
3. sparse **mixed** vegetation; plant types and conditions suggest poorer soil binding.....	3	3
4. mostly **grasses**, few if any trees and shrubs, high erosion and failure potential at high flow..	2	2
5. little or no bank vegetation, mass erosion and bank failure evident.....	0	0
		Total 14

Remarks _____

VII. Light Penetration Canopy is defined as tree or vegetative cover directly above the stream's surface. Canopy would block out sunlight when the sun is directly overhead. Note shading from mountains, but not use to score this metric.

	Score
A. Stream with **good** canopy with some breaks for light penetration	(10)
B. Stream with **full canopy** - breaks for light penetration absent.....	8
C. Stream with **partial** canopy - sunlight and shading are essentially equal.....	7
D. Stream with **minimal** canopy - full sun in all but a few areas.....	2
E. **No canopy** and no shading.....	0

Remarks _____ Subtotal 10

VIII. Riparian Vegetative Zone Width

Definition: Riparian zone for this form is area of natural vegetation adjacent to stream (can go beyond floodplain). Definition: A break in the riparian zone is any place on the stream banks which allows sediment or pollutants to directly enter the stream, such as paths down to stream, storm drains, uprooted trees, otter slides, etc.

FACE UPSTREAM	Lft. Bank Score	Rt. Bank Score
Dominant vegetation: ☑Trees ☑Shrubs ☐ Grasses ☐ Weeds/old field ☐Exotics (kudzu, etc)		
A. Riparian zone **intact** (no breaks)		
1. width > 18 meters.....	(5)	(5)
2. width 12-18 meters.....	4	4
3. width 6-12 meters.....	3	3
4. width < 6 meters.....	2	2
B. Riparian zone **not intact** (breaks)		
1. breaks rare		
a. width > 18 meters.....	4	4
b. width 12-18 meters.....	3	3
c. width 6-12 meters.....	2	2

1.0 MITIGATION PROJECT SUMMARY

The Major Hill Stream and Wetland Mitigation Site (hereafter referred to as the "Site") encompasses 16.7 acres along warm water, unnamed tributaries to Pine Hill Branch. The Site is located approximately 3.5 miles southeast of Snow Camp and 6 miles north of Silk Hope in southern Alamance County near the Chatham County line. Project attributes are included in the following table.

Table 1. Buffer Project Attributes

Project Name	Major Hill
Hydrologic Unit Code	3030002050050
River Basin	Cape Fear
Geographic Location (Lat, Long)	35.873206, -79.360906
Site Protection Instrument (DB, PG)	(2789, 896), (2514, 756), (3143, 270), (3150, 920)
Total Credits (BMU)	402,837
Types of Credits	Riparian Buffer Restoration, Enhancement, & Preservation
Mitigation Plan Date	Apr-18
Initial Planting Date	Dec 2018-Jan 2019
Baseline Report Date	Mar-19
MY1 Report Date	Nov-19
MY2 Report Date	Jan-21
MY3 Report Date	Jan-22
MY4 Report Date	Nov-22
MY5 Report Date	Feb-24

The Site drainage area is primarily composed of pasture, forest, agricultural land, and sparse residential property. Impervious surfaces account for less than five percent of the upstream land surface.

Before construction, Site land use consisted of pasture, hayfields, disturbed forest, and agricultural land used for livestock grazing and hay production. Livestock had unrestricted access to Site streams, and stream banks were eroded vertically and laterally and received extensive sediment and nutrient inputs. Riparian zones in the upper reaches of UT 1 were primarily composed of herbaceous vegetation that was sparse and disturbed due to livestock grazing, bush hogging, and regular land-management activities. The downstream reaches of UT 1 and all of UT 3 were primarily wooded with livestock disturbance to stream channels. UT 2 was the lone tributary not subject to continuous, unrestricted livestock access. Riparian areas immediately adjacent to UT 2 were forested with a fence to protect this area from livestock access.

The riparian areas were restored in concurrence with the Major Hill Stream and Wetland Mitigation Site (NC DMS Project ID 10015, SAW-2017-01472) and involved restoring riparian buffers adjacent to restored streams to help reduce non-point source contaminant discharges to downstream waters in the Haw River sub-watershed of Jordan Lake. All riparian areas were assessed by DWR (Katie Merritt and Sue Homewood) during a site visit on February 20, 2018, to determine the Site's viability for buffer mitigation.

The Site is protected with a permanent conservation easement. Riparian restoration, enhancement, and preservation area widths adjacent to restored streams extend out to a maximum of 200 feet from the top

of stream banks with a minimum width of 50 from the top of banks. Riparian buffer enhancement and preservation credits generated on this Site are allowed pursuant to 15A NCAC 02B .0295 (o). No riparian restoration areas less than 20 feet wide, measured perpendicularly from the top of banks, are used to generate riparian buffer credit.

Riparian Buffer Mitigation Credit was not generated in areas generating wetland mitigation credit.

2.0 REGULATORY CONSIDERATIONS

Credit determination for this Site follows the North Carolina consolidated buffer mitigation rule 15A NCAC 02B .0295, effective November 1, 2015 (see Table 2 on the following page and Figure A, Attachment 1).

3.0 RIPARIAN RESTORATION, ENHANCEMENT, & PRESERVATION PLAN

This Site was also proposed as a stream and wetland mitigation project; therefore, the restoration of riparian areas was accomplished through the goals and methods outlined by the *Major Hill Stream and Wetland Mitigation Plan*. All applicable federal, state and local permits or authorizations were acquired to implement the mitigation plan.

Primary goals focused on 1) improving water quality, 2) enhancing flood attenuation and hydrology, 3) improving aquatic resources, and 4) restoring riparian habitat. Completed mitigation provides floodplain connectivity, floodplain resistance, stream stability, sediment transport, surface and subsurface storage/retention, in-stream habitat, riparian habitat and structure, thermal regulation, floodplain biogeochemical processing, and pollutant filtration/removal of pollutant sources. The riparian area will be restored through the revegetation of native plant communities.

3.1 Riparian Area Restoration Activities

3.1.1 Site Preparation

Soil grading occurred during stream restoration activities. Topsoils were stockpiled during construction activities and spread on the soil surface once critical subgrade was established. The replaced topsoil will serve as a viable growing medium for community restoration to provide nutrients and aid in the survival of planted species.

Farm Pond Removal

To complete the stream and wetland restoration activities and subsequent riparian buffer restoration, the removal of a small farm pond, ~0.58 acres, occurred. Stream, wetland, and riparian area restoration within the abandoned pond included 1) notching the dam to dewater; 2) removal of the dam to the elevation of the adjacent floodplain; 3) excavating sediment that is unsuitable for channel bank construction; 4) backfilling areas of sediment removed with soil suitable for channel construction (as necessary); 5) excavation of the design channel, 6) stabilization of the channel with coir matting, seed, and mulch; and 7) installation of structures.

Table 2. Buffer Project Areas and Assets

RIPARIAN BUFFER (15A NCAC 02B.0295)

				SUBTOTALS	**595,699**				**397,528.594**		**13,267.960**	**854.558**
			ELIGIBLE PRESERVATION AREA		**198,566**							
Location	**Jurisdictional Streams**	**Restoration Type**	**Reach ID/ Component**	**Buffer Width (ft)**	**Creditable Area (sf)***	**Initial Credit Ratio (x:1)**	**% Full Credit**	**Final Credit Ratio (x:1)**	**Riparian Buffer Credits (BMU)**			
Rural	Nonsubject	Preservation	4	0-100	25,614	5	100%	5.00000	5,122.800			
Rural	Nonsubject	Preservation	5	101-200	2,814	5	33%	15.15152	185.724			
				SUBTOTALS	**28,428**				**5,308.524**			
				TOTALS	**624,127**				**402,837.117**			

**Area eligible for preservation may be no more than 25% of total area, where total area is back-calculated with the equation R+E/0.75.*

**Buffers must be at minimum 20' wide for riparian buffer credit, buffers must be 50' wide for nutrient offset credit*

**When preservation areas exceed the total eligible preservation area, select the areas with the best credit ratios as the creditable areas.*

3.1.2 Planting

Bare-root seedlings within the Piedmont Alluvial and Dry-Mesic Oak-Hickory Forests were initially planted at a density of approximately 680 stems per acre on 8-foot centers. Species in the streamside assemblage and Marsh Wetland Treatment Areas were planted at a density of approximately 2720 stems per acre on 4-foot centers. The following table summarizes planted bare-root stems within the Site.

Table 3. Planted Bare Root Woody Vegetation

Species	Piedmont/Low Mountain Alluvial Forest	Dry-Mesic Oak/Hickory Forest	Marsh Treatment Wetland	Streamside Assemblage	Total
Acres	**1.1**	**5.5**	**0.01**	**1.5**	**8.11**
Alnus serrulata			5	20	25

Sambucus canadensis			11	14	25
TOTALS	750	3,740	26	4,084	**8,600**
Stems/Acre	682	680	2600	2722	**1060**

*Live stakes of *Salix nigra* were planted; all other planted species were planted as bare root plants.

3.2 Riparian Buffer Enhancement via Cattle Exclusion Activities

Riparian buffer enhancement included permanently protecting the existing riparian buffer from livestock via exclusionary fencing, cutting, clearing, filling, grading, and any similar activities that would affect the functionality of the riparian buffer. These areas are defined primarily as disturbed mixed hardwoods. Buffer credits sought in the enhancement area are allowed under 15A NCAC 02B .0295 (o)(6). The enhancement area extends a maximum of 200 feet from the top of the bank with a minimum width of 20 from the top of stream banks.

A small portion of UT-3 generates riparian buffer enhancement credit from only one side of the stream. Before construction, cattle had access to the entire area; however, the only access point was from the pasture on the northern side of the stream, the parcel owned by Mr. Lamm. Once fencing was installed to prevent cattle access from Mr. Lamm's parcel to the stream, cattle were no longer able to access the south side of the stream. This action will result in compliance with 15A NCAC 02B .0295 (o)(6), which states that the permanent exclusion of grazing livestock must be done such that the livestock are fenced out of the stream and its adjacent buffer. The southern parcel, which is not a part of the conservation easement, is owned by the Caviness family and is a single-family home.

3.3 Riparian Buffer Preservation Activities

Riparian buffer preservation includes permanently protecting existing riparian buffers from cutting, clearing, filling, grading, and any similar activities that would affect the functionality of the riparian buffer. Areas specified for Preservation at the Site, in accordance with 15A NCAC 02B .0295, are defined primarily as mixed hardwoods, with a number of high-value species and over 200 species total per acre. They are areas where livestock was fenced out before construction – these areas had little or no historical livestock access.

3.4 Marsh Treatment Area

A marsh treatment area was constructed to intercept surface waters draining through agricultural areas before discharging into UT1. The marsh treatment area is excluded from credit calculations.

4.0 ANNUAL MONITORING

4.1 Monitoring

Eight vegetation monitoring plots (10-meter by 10-meter) were installed within the Site as per guidelines established in *CVS-EEP Protocol for Recording Vegetation*, *Version 4.2* (Lee et al. 2008); this covers 3.4% of the area generating riparian buffer restoration credit. Vegetation monitoring will occur annually in the fall (between September and November), prior to the loss of leaves for a period of five monitoring years following planting. Parameters to be monitored include species composition and species density. Visual observations of the percent cover of shrub and herbaceous species will also be documented by photograph. In addition, inspections for beaver and other potential nuisance species will occur throughout the monitoring period.

The following table outlines riparian buffer monitoring for this project; monitoring parameter descriptions follow.

Table 4. Riparian Buffer Monitoring

Required	Parameter	Quantity	Frequency	Notes
Yes	Vegetation	Eight (8) plots located across all restored buffer zones.	Annual	Vegetation will be monitored for five years or until performance standards are met. Visual monitoring of the site will be done all five years. Analysis of vegetation will be recorded using level 2 CVS Monitoring protocol.
Yes	Project Boundary	NA	Annual	Locations of fence damage, vegetation damage, boundary encroachments, etc. will be mapped.

4.2 Performance Standards

Performance standards were established to verify that the vegetation component supports community elements necessary for forest development and the maintenance of diffuse flow through the riparian buffer in accordance with North Carolina Division of Water Resources Administrative Code 15A NCAC 02B.0295 (Mitigation Program Requirements for Protection and Maintenance of Riparian Buffers). Performance standards are dependent upon the density and growth of at least four native hardwood tree species where no one species is greater than 50% of the stems. After five years of monitoring, an average density of 260 woody stems per acre, including planted shrubs (silky dogwood and blueberry), must be surviving, and diffuse flow maintained. 15A NCAC 02b .0295 (2)(E) dictates that monitoring for planted stems would also include the health of planted stems. Level 2 CVS monitoring protocol requires the vigor, a determinant of health, of a monitored stem be recorded. If requested, RS will make available during the monitoring years, planted stem health, e.g. vigor.

4.3 Results and Discussion

In early January 2020, a winter-time visual assessment of the Site was performed, and it was determined that although Year 1 (2019) vegetation data, including random transects, showed a high density of trees, a light supplemental planting would help ensure the long-term success in several areas. On January 31, 2020, three areas that visually exhibited low stem density and/or poor vigor were supplementally planted. During the supplemental planting effort, approximately 370 stems were planted across 1.20 acres (approximately 300 stems per acre). As the planting was designated for visual purposes and was not an effort to increase stem density data, no stems were planted within permanent vegetation plots. The following table lists species included in the supplemental planting list. Preparation included the application of 100 lbs of lime, 50 lbs of fertilizer, and 3 lbs of seed to stabilize bare areas (see Figure A for planting areas).

2020 Supplemental Planting Species List

Species	Number of Stems
Tag Alder (*Alnus serrulata*)	20
Chinkapin (*Castanea pumila*)	20
Hackberry (*Celtis occidentalis*)	50
Hawthorn (*Crataegus marshallii*)	20
Crab Apple (*Malus angustifolia*)	50
Red Mulberry (*Morus rubra*)	100
Sycamore (*Platanus occidentalis*)	50
Shumard Oak (*Quercus shumardii*)	50
Total	**370**

Based on the number of stems counted, average densities were measured at 354 hardwood tree stems per acre (excluding livestakes, shrubs, pines, and vines) in year 5 (2023). In addition, all but two permanent plots met success criteria based on planted stems alone. Plot 1 meets success criteria when including naturally recruited stems of green ash (*Fraxinus pennsylvanica*). Additionally, two temporary vegetation transects also met success criteria. The following Table 5 summarizes riparian buffer success criteria and Table 6 summarizes all permanent vegetation plot data by species, plot, and year. Table 7 summarizes all

temporary vegetation plot data by species and transect. Vegetation plot photographs are included in Appendix B of the *Major Hill Stream and Wetland Mitigation Site Year 5 (2023) Annual Monitoring Report*.

Average Planted Stems/Acre	**Yes**	**354**	**457**

4.4 2023 Maintenance and Management

Restoration Systems continues to monitor fescue throughout the Site. Based on permanent and random vegetation monitoring plots and visual observations, planted stems are establishing within areas where fescue was a concern.

On September 27, 2023, RS Staff members discovered an encroachment area measuring .04 acres on the site's south side shown on Figure 2 (Appendix B). An existing cattle fence was not relocated to boundary corners during construction. On December 02, 2023, the fence was relocated to outside of the easement. On December 05, 2023, a supplemental planting of twenty 3-gallon pots of mitigation plan approved species including of 5 Black gum (*Nyssa Sylvatica),* 5 Water Oak (*Quercus nigra*), and 10 Willow Oak (*Quercus phellos)* were planted within the encroached area, see Easement Inspection MY5 (2023) Photo Log.

Response to Easement Boundary Inspection Year 5 (2023) Comments

Major Hill Mitigation Site (DMS #100015)
Cape Fear River Basin 0303002, Alamance County
Contract No. 100015

Comments Received (Black Text) & Response (Blue Text)

Danielle L. Mir, Eastern Project Manager, NC DEG Division of Mitigation Services

1. There were no conservation easement signs anywhere along the fence line.
   Response: Easement signs were installed at all easement corners and within easement boundary lines longer than 200 feet.

2. North side of fence corner falls about 12”-18” inside easement. The fence needs to be moved outside of the easement.
   Response: The fence built inside the easement at easement corner 1 will remain in place due to property constraints and large trees in-line of the property boundary. Please NC DMS Email Correspondence (Appendix H).

3. Cap does not have the survey number stamped which corresponds to the coordinates.
   Response: Survey cap 1 was determined to be appropriately stamped. See Easement Inspection MY5 (2023)se Photo Log (Appendix H).

4. There is not a 3 ¼ inch aluminum cap on this corner.
   Response: Easement corner 2 is a property corner identified as an existing iron pipe, see Map of Record (Appendix H).

Hello Josh,

FYI. I just spoke with our property person, he let me know that there is another property owner near that corner that I marked red in the parcel's that I labeled A & B. . If the property mark is right on the parcel boundary, the fence cannot go outside the easement into another person's property. Since you will have a surveyor out to put a seal on the plates and verify, it may be helpful to make sure and mark that there is a different parcel. (The Easement shape and county parcel may not be all georeferenced properly since much of the project looks to be in parcel B – this is a quick overlay with nc one map)

Parcel A = Andrew M Tinnin (104203)
Parcel B = Andrew M Tinnin (104211)
Parcel C = Carol Lamim (104191)

Please let me know if you have any questions.

Hey Danielle,

Thank you for your update and phone call. RS will work on resolving your noted issues.

We will coordinate with you on another site visit this Fall once the boundary has been thoroughly inspected and all issues are resolved.

Thanks again,
Josh M.

Joshua Merritt
Project Manager

Subject: Major Hill Stream and Wetland Restoration Site (100015) - Property Boundary Issues

Hello Josh,

We went to Major Hill Thursday afternoon and looked at about 25% of the boundary. We will be happy to reschedule a full boundary inspection after the following items are addressed:

Entire Property

- There were no conservation easement signs anywhere along the fence line. (Please refer to the 3rd bullet of items 7, Step Three: Task 2 Payment, page 16 of the RFP below)

Placemark 1

- **Photo 1** – North side of fence corner falls about 12”-18” inside the easement.
  - The fence needs to be moved to the outside of the easement.

- **Photo 2** – Cap does not have the survey number stamped which corresponds to the coordinates. (Please refer to the 1st bullet of item 7, Step Three: Task 2 Payment, page 16 of the RFP below)

Placemark 2

- **Photo 3** – There is not a 3 ¼ inch aluminum cap on this corner.

Please note, that we did not look at the entire site and it is advised for you all to check all boundary corners prior to us coming out. Please let me know if you have any questions.

Have a great day.
-Danielle

Step Three: Task 2 Payment

The Contractor will complete the seven (7) listed deliverables along with invoice for Task 2 payment. Document deliverables shall be submitted electronically to the DMS project manager and SPO Manager Blane Rice (Blane.Rice@doa.nc.gov). Additionally, SPO requires one (1) hard copy of all the original documents and a compact disk mailed to Blane Rice, NC Department of Administration, State Property Office, 1321 Mail Service Center, Raleigh, NC 27699-1321. Once received, SPO will issue authorization for payment.

1. Recorded Conservation Easement in Adobe PDF form
2. Recorded Survey Plat in Adobe PDF form
3. Updated digital easement file in AutoCAD (.dwg) and ArcMap (.shp) format
4. Final attorneys report on title based on 30-year search with deeds and documentation.

Additionally, the following must be satisfied during Task 2:

5. Original title insurance policy shall be forwarded to SPO as soon as it is available to Blane Rice.
6. Provide the name, address, phone number, and e-mail address (if available) of each grantor via electronic communication to SPO and DMS.
7. Install survey monumentation and conduct boundary marking with the following specifications:
   - The Contractor shall set 5/8" rebar 30" in length with 3-1/4" aluminum caps on all easement corners. Caps shall meet DMS specifications (Berntsen RBD5325, imprinted with NC State Logo # B9087 or equivalent). After installation, caps shall be stamped with the corresponding number from the table of coordinates on the survey.
   - The Contractor shall place a 6-foot tall durable witness post at each corner in the conservation easement boundary. Posts shall be made of material that will last a minimum of 20 years.
   - The Contractor shall attach a conservation easement sign to each witness post and place additional signs at no more than 200-foot intervals on long boundary lines. When applicable, the Contractor can mark existing trees (>3dbh) with conservation easement signs and/or blaze property lines at approximate eye level in lieu of line posts. Where applicable, established fence posts can be used for placement of signage.

Hello Josh,

After speaking with the Property Team and Stewardship the fence at Major Hill on the north end is where it should be. The corner, that is 18" inside the easement will **not** need to be moved. I hope this helps.

Have a great day.
-Danielle
