Re: Lake Jordan Water Supply Allocation
Harnett County, North Carolina

Dear Mr. Morris:

The purpose of this letter is to serve as our introductory letter transmitting the Harnett County/Lake Jordan Round Three Water Supply Allocation Application to the Division of Water Resources for your review and consideration. Harnett County is pleased that we have been able to plan for a water system that will meet the needs of the region of the Cape Fear Valley located between Wake County and Cumberland County. Our outreach not only includes four of the seven incorporated Towns within the County, but all of the incorporated area and areas within Wake County, Cumberland County and Moore County. We are currently in discussions to provide water to parts of Chatham County and Lee County. We are truly a regional system and are blessed that the Cape Fear River provides an abundance of good quality water for us to treat to serve our growing customer base.

In your instructions for the Application, you request that the County specifically provide information regarding the following four factors:

1. ***A commitment to all financial obligations related to receiving the allocation from Jordan Lake.***

The County and the Harnett County water system recognize that should we be successful in obtaining an allocation from Lake Jordan that there is an annual commitment that will be required to provide for the operation and maintenance of Jordan Lake. The cost of this fee would be passed on to our 60,000 plus service population in the form of an increase in user charge. Given the size of our system, the increase required for this fee would be nominal and have minimum impact on our user fees. The Harnett County water system

will commit to this user fee increase if we are successful in obtaining our allocation.

2. ***The total level one and level two water supply storage allocation requests in mgd.***

A detailed discussion of the County's allocation request is presented in Section V of the Application. Since Harnett County depends on a run of river water supply, we believe it appropriate to ensure sufficient supply is available for the maximum day demand of the system. While it is noted that Level Two requests extend for a 30 year planning period, Harnett County is projected to need an additional 18 mgd at the end of its 50 year planning period beginning in year 2033. Accordingly, this request is for 18 mgd.

3. ***Description of any regional partnerships in which the applicant is participating.***

Harnett County supplies water as a regional partner to units of government within the County and in three counties surrounding Harnett County. The systems currently under contract to purchase water from Harnett County include the Towns of Coats, Lillington, Angier, Linden, Fuquay Varina, Holly Springs, Woodlake, Moore County, and Spring Lake.

4. ***Any additional information that would be helpful in evaluating the application and documenting the applicant's need for using Jordan Lake.***

The Harnett County intake is uniquely situated along the Cape Fear just up-stream of the low flow gauging station at Lillington, accordingly, as part of the allocation process, the County requests that the Division of Water Resources consider a better defined operational rule which we believe would allow the County to withdraw water from a river water supply at Lillington and meet the County's needs well into the future without having to obtain an allocation from Jordan Lake. This can be achieved through the Corps of Engineers including water withdrawn from the river at the water intake in the low flow target at the Lillington gauge. A further discussion of this is provided in Section III of the Application.

We appreciate this opportunity to form a well-planned water supply for all systems on the Cape Fear River. If we can provide additional information, please let us know.

Sincerely,

Rodney M. Tart, Director

RMT/cm

Section I. Water Demand Forecast Documentation

1. Methodology

The Harnett County water system is unique in the number of separate systems served and diversity of their customer base. The system provides water to four of the six incorporated areas within the County and all of the unincorporated area. Outside of Harnett County, the system serves areas of the surrounding Counties of Wake, Cumberland and Moore County. Talks are underway to provide water to Chatham and Lee County. Incorporated areas outside of the County served by the water system include Holly Springs, Fuquay-Varina, Woodlake and Spring Lake. For the purposes of determining system populations as a part of the round three Jordan Lake Water Supply Allocation, Lillington, Coats, Angier, and Linden are assumed to be a part of the overall Harnett County system in terms of growth rates and per capita water consumption. Systems outside of the County are considered to be separate and the population projections and demands for each of these systems are derived independently.

2. Harnett County Population and Demands

After analyzing the data available to Harnett County water system to project system demands, it was determined that 1997 would serve as a base year. This is selected since each of the systems within the County that will be included within this demand projection completed the 1997 Water Supply Plans. Accordingly all of the data used will be derived in this base year. Below is a table listing the 1997 water use statistics for each of the systems. Adjustments of demand were required to match with the record of water consumption recorded by the Harnett County water system.

| Water System | Number of Residential Customers | Residential Demand mgd | Commercial Demand mgd | Industrial Demand mgd | Loss mgd | In-plant Consumption mgd |
|----------------|---------------------------------|------------------------|-----------------------|-----------------------|--------------|--------------------------|
| Harnett County | 19,350 | 2.8 | 0.04 | 0.05 | 0.61 | 0.149 |
| Lillington | 1,015 | 0.109 | 0.018 | 0.233 | 0.124 | |
| Coats | 920 | 0.116 | | | 0.084 | 0.036 |
| Angier | 1,920 | 0.255 | 0.07 | 0.009 | 0.01 | .02 |
| Linden | 340 | 0.049 | 0.001 | | | |
| TOTALS | 23,545 | 3.329 | 0.129 | 0.292 | 0.808 | 0.149 |

Lillington: Adjusted 200 industrial customers to residential. Additionally adjusted water loss so that total average demand would equal 0.484.

Coats: Adjusted usage to 0.2 mgd.

Angier: Adjusted usage to 0.324.

The estimated system population in 1997 is 61,217 (23,545 x 2.6 persons per household). Using data supplied by the State of North Carolina, it can be determined that the growth rate experienced by the County between 1990 and 1999 is 2.59 percent. Even though it can be estimated that the growth rate in the future for Harnett County will be greater than that experienced during the 1990 decade when compared to the growth rate that Wake County has been experiencing over the last two decades, it is reasonable to consider for this study that the growth rate will remain constant through 2050. The 2000 population estimated for the County's water system is 66,097. The 2050 population is estimated to be 237,374. (See worksheet).

The per capita consumption estimated for the year 2000 is obtained by dividing the average water use per County water system by the estimated population (4.08 mgd ÷ 66,097). This makes the per capita consumption for the year 2000 to be 62 gpd/cap. This consumption appears to be reasonable when compared to surrounding systems. Accordingly, it will be used for demand projections for the County system during the study period.

3. Systems Outside the County Under Contract

Holly Springs

The Harnett County water system is currently contracted to supply up to 2 mgd to the Town of Holly Springs. Additionally, the County has just recently completed the construction of the 36 inch diameter water line to serve Holly Springs and Fuquay-Varina. Holly Springs has hydraulic capacity within the 36 inch water line to allow the County to supply up to 8.5 mgd to the Town. Since Holly Springs is applying for an allocation request from Lake Jordan that will be used by Harnett County to meet their future demand, Holly Springs is not considered as a part of this analysis.

Fuquay-Varina

Fuquay-Varina is currently under contract with three different water systems to meet their demands. Raleigh through Garner along Highway 401 connection can supply up to 0.75 mgd. Johnston County through the Highway 42 connection can supply up to 2 mgd. Fuquay-Varina is currently contracted with Harnett County for 1 mgd and has a conveyance allocation in the new 36 inch pipeline of 5 mgd. Developing future demands from Fuquay-Varina, it is assumed that all of the water supply in excess of the existing contract amounts required to meet the future demand will be supplied by Harnett County. A summary of the demand projections is as follows:

In determining the future demands for Fuquay-Varina, the demands projected in the 1997 Water Supply Plans were extrapolated through the Year 2050.

DEMAND PROJECTIONS

| Year | 1997 | 2000 | 2010 | 2020 | 2030 | 2040 | 2050 |
|-----------------------|-------|-------|------|------|------|------|------|
| Demand | 0.719 | 1.051 | 2.19 | 4.67 | 6.22 | 8.01 | 9.79 |
| Harnett County Demand | 0.5 | 0.5 | 1.1 | 1.92 | 3.47 | 5.76 | 7.04 |

Woodlake

Woodlake did not submit a Water Supply Plan to use as a base. System is receiving all of its service from Harnett County as of the year 2000. Since Woodlake is a resort community, we have estimated a growth rate of 3 percent a year and have applied that to the year 2000 demand to estimate the demand for the entire period. The demand estimates are shown in the following table.

DEMAND PROJECTIONS

| Year | 2000 | 2010 | 2020 | 2030 | 2040 | 2050 |
|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Demand | 0.093 | 0.125 | 0.168 | 0.225 | 0.303 | 0.408 |

Riverside

Riverside is a private water system that was purchased by the County and brought on-line in 2001. Since the Riverside demand is not included in the projections within the County, their demands are estimated separately at the growth rate of 2.59 percent per year. The Riverside system demand projections are shown in the following table.

DEMAND PROJECTIONS

| Year | 2000 | 2010 | 2020 | 2030 | 2040 | 2050 |
|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Demand | 0.04 | 0.517 | 0.665 | 0.086 | 0.111 | 0.144 |

Summaries of these data are shown in the attached worksheet. It should be noted that demand data presented is based upon the average daily demand. This may be adequate to evaluate water supplies available from a reservoir source, it is necessary to use a maximum day demand analysis to properly evaluate water available from a run of the river source. Accordingly, the worksheet displays the maximum day demand estimates in the study period. The max day/average day demand ratio used in these projections is 1.5. While this number is somewhat lower than the existing system ratio, it is expected that as the system develops the more users and a greater diversity of use meet max day water demand ratio will drop to this level.

**SECTION II. CONSERVATION & DEMAND
MANAGEMENT**

1. Water Shortage Ordinance (Attachment I.)

Harnett County established a water shortage ordinance in 1992. The purpose of the ordinance was to conserve water by controlling residential outdoor use. Since inception the County has enacted the ordinance three times during three different years. The ordinance was in effect from May through September when outdoor use is highest. The program allows watering for each customer twice per week. The location of the residence (geographic area) determines which days watering is allowed.

2. Conservation Rate Structure (Attachment II.)

Harnett County Utilities a flat rate structure. Residential customers pay \$13.10 for the first two thousand gallons and \$3.20 for each subsequent thousand gallons. Commercial customers pay \$17.00 per month plus \$2.55 per thousand over two thousand gallons. Institutional customers pay \$1.55 per thousand based on minimum usage of 525,000 gallons per month.

3. Leak Detection and Repair (Attachment III.)

During fiscal year 1999-2000, Harnett County Utilities repaired a total of 163 leaks. This amount of leaks equals 978 total billable man-hours. Repaired leaks require ^{these} technicians, one dump truck, one trailer, one backhoe and one service truck. The leaks are logged in the "Daily Log Report." This report is used monthly to update maintenance reports. The maintenance report is used to generate reports on:

1. Water Loss
2. Overtime
3. Water Quality
4. Equipment Hours

Harnett County Utilities currently uses Auto CAD Map to digitize all our "As-builts." Currently 50% of the water system is digitized. Our goal is to increase digitalization 10% annually until 100% complete. When completed, our infrastructure including all meters, valves and hydrants will be plotted within a centimeter accuracy. Harnett County also employs a Water Quality Technician. It is the responsibility of this individual to help maintain and report water quality in the distribution system. Our technician is trained to look for leaks when traveling throughout the County. The departments meter readers also look for leaks when reading meters. This occurs approximately 20 days per month.

The Water Operations Division also monitors for leaks with the system SCADA System. The operator will look specifically at demand trends over times as long as day or as short as five minutes and compare to past trends with similar conditions. The operator and SCADA system are also equipped with suction and discharge pressure gauges at each of our fourteen booster pump stations. The operator can find a sizeable leak by comparing pressure readings at the station and elevated tank levels.

4. Annual Water Audits (Attachment IV.)

Water loss reduction objectives are set at 10% maximum loss for the year. Over the last five years the department has reduced the overall distribution loss from 19.3% to last years total of 9.7 %. This year's loss (enclosed) exceeded 10% due to water plant piloting studies. During the pilot study it was possible to waste as much as 3 mgd to maintain 6 gpm/ft. in our filters. This pilot program was endorsed and monitored by the North Carolina Public Water Supply Section.

5. Public Education Program (Attachment V.)

Harnett County realized the need for a public education program when it became necessary to facilitate a conservation ordinance. Since 1992 we have sent out mailing from AWWA and NRWA providing tips on outdoor water use. The water plant actively encourages schools to visit our facilities. Tour groups such as schools are always given water saving fact sheets when visiting our facilities. Harnett County has also established a web site for our customers. Besides billing information there are numerous water saving tips for the consumer.

6. Plumbing Retro-Fit Program

The County does not have a program in place at this time. It has been noticed by our department head of other utilities utilizing this program. Discussions have been held in recent staff meetings. The issue has been tabled until the January 2001 staff meeting.

7. Evaluation of Water Re-Use

Harnett County is fortunate to own elaborate and sophisticated water utility. Our wastewater endeavors have moved at a slower pace. The County tried to work an agreement with the Carolina Lakes golf course in the early 1990's to use effluent from our .300 mgd spray irrigation facility located at Carolina Lakes. The golf course was interested, but the County could not produce enough effluent to make the project viable. In the next decade more efforts will be put into water re-use. The County has purchased the Town of Lillington Wastewater Treatment Plant, as a County Regional Facility. As the collection system and plant expand water Re-use will become more feasible. Immediate plans include using a portion of the effluent at the Lillington Plant to develop a tree farm for beautification at all of Harnett County government complexes.

SECTION III. CURRENT WATER SUPPLY

Section III. Current Water Supply

Harnett County currently draws water through a run of the river source located approximately 1,000 feet upstream of the Lillington gauging station on the main stem of the Cape Fear River. Following are pertinent statistics of river flow at the Lillington gauge.

| | |
|---------------------------------|------------|
| Mean Annual Discharge | 3,504 cfs |
| 10% Exceedence Flow | 10,700 cfs |
| 50% Exceedence Flow | 1,310 cfs |
| 90% Exceedence Flow | 619 cfs |
| 7Q10 | 530 cfs |
| Low flow of record (since 1982) | 210 cfs |

While there is currently a work group evaluating the run of river supply of the Cape Fear River below the dam, the basic policy of the North Carolina Division of Water Resources and the North Carolina Division of Environmental Health for run of river water supply to limit the supply to the lower of either 20 percent of the 7Q10 flow or the minimum flow of record. Twenty percent of the regulated 7Q10 is 69 mgd, therefore be used as the maximum in-stream withdrawal allowable during low flow conditions. In a letter dated December 6, 2000 to John Morris of the Division of Water Resources, Rodney Tart of Harnett County requested confirmation of their understanding of the withdrawal limits; i.e, maximum withdrawal amount will be limited to 50 cfs (32 mgd). Accordingly, the Water Supply Plan included as a part of this application includes an analysis for both 32 mgd and 69 mgd.

SECTION 3: WATER SUPPLY SOURCES

*NOTE Column 5 R=Regular Use, E=Emergency Use

3-E. What is the Total Amount of Purchase Contracts available for Regular Use? 0.0 MGD (Do not include emergency use connections in total)

SECTION IV. FUTURE WATER SUPPLY NEEDS

Section IV. Future Water Supply Needs

Future water supply needs are analyzed in three ways. First using the Round Three Lake Jordan Allocation rules, water needs are determined using the average day demand. The current withdrawal allocation from the river of 32 mgd. The second compares the projected maximum day demand to the current allocated withdrawal from the river. Finally, the water supply available from the Cape Fear River is estimated using the current policy of the Division of Water Resources citing that the available water supply from a run of river source is equal to 20 percent of the 7Q10. The data in each of these analyses is displayed in the worksheet, both in tabular and in graph form.

As discussed previously, the projected demands for the Harnett County system for the year 2050 are for an average day demand of 33.77 mgd and a maximum day demand of 50.66. The current allocation from the river is 32 mgd. Referring to the daily demand chart in the accompanying worksheet, one can see that the intersection of the supply and demand curves for an average day occurs around the year 2048. At the end of the planning period, there is a deficit of 1.77 mgd. Similarly using the maximum day demand curve, the point of intersection of supply and demand occurs around the year 2033. By the end of the planning period, the maximum day demand exceeds the supply by 18.66 mgd.

The same chart displays the available supply of 69 mgd. The basic policy of the Division of Water Resources is utilized estimating the maximum withdrawal at low flow conditions to 20 percent of the 7Q10. If this policy is in effect, then there will be a surplus of water available to Harnett County at the end of the planning period amounting to 35 mgd and 18 mgd on an average day or maximum day basic respectively. The analysis of this data returns Harnett County to the same position and considerations that were present in their original requests to the Division of Water Resources in the Spring of 1997. That is if a State is going to adopt its basic policy of run of river intakes for non-regulated streams and allow its application on the Cape Fear River, then no allocation from Lake Jordan would be necessary for this planning period. The major issue to be resolved is the use of water quality pool water for drinking water purposes prior to the gauging station at Lillington. It would seem reasonable since the gauging station is so close to the intake at Lillington, that the amount of water withdrawn from the river by Harnett County be counted as a part of the gauged water at

Lillington. The withdrawal can be relayed to the Corps of Engineers to be added to the stream gauge to meet the 600 cfs target goal.

In the absence of a favorable decision in this regard, Harnett County has no option but to request a Level II Allocation from Lake Jordan.

SECTION 8: FUTURE WATER SUPPLY NEEDS

Local governments should maintain adequate water supplies to ensure that average daily water demands do not exceed 80% of the available supply. Completion of the following table will demonstrate whether existing supplies are adequate to satisfy this requirement and when additional water supply will be needed.

Table 8-A. AVERAGE DAILY DEMAND AS PERCENT OF SUPPLY Show all quantities in MGD.

| Available Supply, MGD | 2000 | 2005 | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |

8-B. Does Line 10 above indicate that demand will exceed 80% of available supply before the year 2030? No Yes

If yes, your Jordan Lake Water Supply Storage Allocation Application should include the following items:

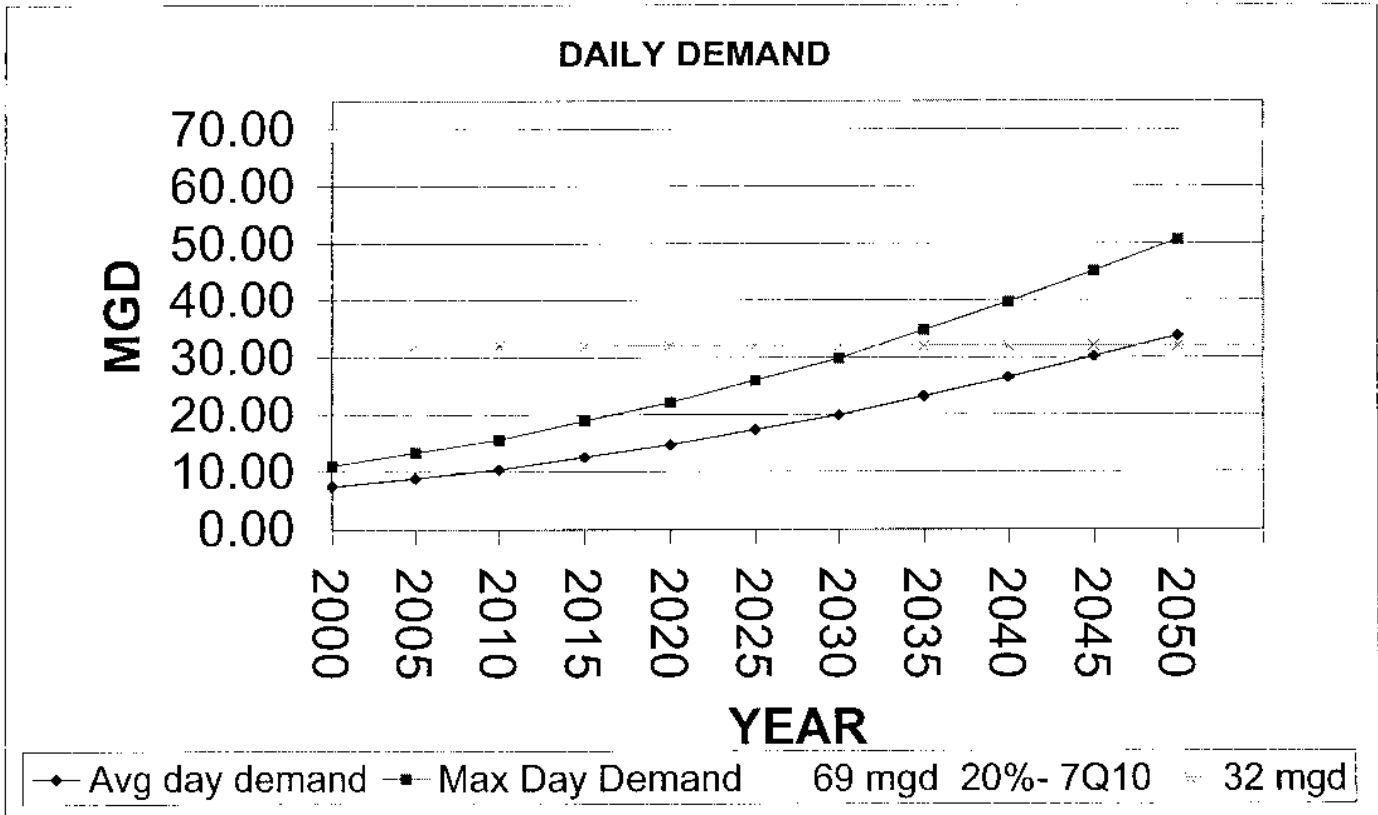

- (1) Alternatives for obtaining additional water supply to meet future demands. Use the following tables to summarize the various future water supply alternatives available to your system. Attach a detailed description of each water supply project shown in each alternative. The sooner the additional supply will be needed, the more specific your plans need to be.
- (2) A demand management program to ensure efficient use of your available water supply. A program should include: conducting water audits at least annually to closely monitor water use; targeting large water customers for increased efficiency; modifying water rate structures; identifying and reducing the amount of leaks and unaccounted-for water; and reusing reclaimed water for non-potable uses.
- (3) Restrictive measures to control demand if the additional supply is not available when demand exceeds 80% of available supply, such as placing a moratorium on additional water connections until the additional supply is available or amending or developing your water shortage response ordinance to trigger mandatory water conservation as water demand approaches the available supply.

Future Supply Alternative List the components of each alternative scenario including the planning period when each component will come online.

SECTION V. ALTERNATIVE WATER SUPPLIES

Section V. Alternative Water Supplies

Alternative water supply sources have been evaluated in a brainstorming session with The Wooten Company and Harnett County staff. The alternatives considered are listed on the attached evaluation sheet with comments included in each of the attributes as requested in the Lake Jordan Allocation guidelines. Due to the discussion of water supply source as presented in the previous section, a detailed cost evaluation of the alternatives was not completed. Two of the alternatives, however, are worthy of additional consideration if the run of river source is not adequate. The first would be the utilization of quarries for off-stream storage by stream flow augmentation. The other alternative would be the development of a new reservoir up-stream of the Lillington intake.

Off-stream storage is considered a viable alternative due to the close proximity of the intensive quarry operations to the water plant. South of Lillington is a major quarry that is still in production. Discussions with the quarry operators indicate that they expect that the quarry will continue to yield economical production for the company forty plus years into the future. Accordingly, as we approach year 2020 to 2025 serious discussions should be underway with the quarry operators to make a determination as to the suitability of this for flow augmentation.

With respect to the construction of a dam on the Cape Fear River, the North Carolina Water Plan Progress Report, Chapter 27 – Cape Fear River Basin, Volume 1 dated January 1972, was reviewed. In that report, the results of the analysis of a number of dam sites on the Deep River were presented. Assuming the worst case scenario of having to develop a safe to yield of 18 mgd and utilizing the detailed design cost data presented in the aforementioned study, we believe that a suitable site would require a drainage area of between 100 and 150 square miles. A combination of dam Sites Four and Five located in western Moore County will have a total drainage area of 129 square miles. Based upon the analysis prepared by the Corps of Engineers on these sites, the dams would impound approximately 16,800 acre feet of storage over approximately 1,300 acre reservoir. The total estimated cost in today's dollars is approximately \$15,000,000. Copies of the detailed design data prepared by the Corps is attached herewith.

SECTION VI. PLANS TO USE JORDAN LAKE

Section VI. Plans to Use Lake Jordan

Under current Lake Operational rules, Harnett County will notify the Corps Office of the next day projected water system demand. The Corps would then add this demand to the amount of water needed to maintain the minimum target flow at Lillington and recall the additional water. Harnett County will then pump the released water from the river for treatment.

| Woodlake | 03-63-114 | 0.093 | 365 | 0.14 | | 6 | R |
| Holly Springs | 03-92-050 | 0.243 | 365 | 1.00 | 01-01-2041 | 12 | R |
| Dunn | 03-43-010 | 0.00 | 0 | 2.50 | Perpetual | 6 | E |
| Erwin | 03-43-035 | 0.00 | 0 | 1.00 | Perpetual | 6 | E |
| Johnston County | 03-51-070 | 0.00 | 0 | N/A | Perpetual | 12 | E |

*NOTE Column 5 R=Regular Use, E=Emergency Use

2-H. What is the Total Amount of Sales Contracts for Regular Use? 1.69 MGD

SYSTEM NAME Harnett County Public Utilities PWSID 03-43-045

SECTION 3: WATER SUPPLY SOURCES

3-A. SURFACE WATER List surface water source information. Mark and label locations of intakes on the System Map.

| 1 Name of Stream and/or Reservoir | 2 Drainage Area Square Miles | 3 Is Withdrawal Metered? Y / N | 4 Sub-Basin | 5 Average Daily Withdrawal for days used | | 6 Maximum Day Withdrawal MGD | 7* Available Supply | | 8* System Component Limiting Daily Output | | 9 Useable On-Stream Raw Water Supply Storage Million Gallons | 10* R or E |
|--------------------------------------|------------------------------------|--------------------------------------|-----------------|---|-----------|------------------------------------|------------------------|---------------|--|--------------|---|---------------|
| | | | | MGD | # of Days | | MGD | MGD | Qualifier | Capacity MGD | | |
| Cape Fear | 3600 | Y | Cape Fear (2-3) | 7.37 | 365 | 12 | 32 | T | 12 | R | N/A | R |
| PLAN HIGH RATE | | | | | | | | | | | | |
| TO 18MGD SUMMER | | | | | | | | | | | | |
| | | | | | | | 32 | Totals | 12 | | | |

NOTES Column 7 Supply Qualifiers: C=Contract amount, SY20=20-year Safe Yield, SY50=50-year Safe Yield, F=20% of 7Q10 or other instream flow requirement, T=Treatment plant capacity, O=Other (specify)

Column 8 Component: R=Raw water pumps, T=Treatment facilities, M=Transmission main, D=Distribution system, O=Other (specify)

Column 10 R=Regular Use, E=Emergency Use

3-B. What is the Total Surface Water Supply available for Regular Use? 12 MGD

3-C. Does this system have off-stream raw water supply storage? No Yes Useable Capacity 60.7 Million Gallons

3-D. WATER PURCHASES FROM OTHER WATER SYSTEMS IN 2000

List all systems that can supply water to this system through existing interconnections (regular and emergency). Mark the locations of the connections on the System Map.

| 1 Water supplied by: | | 2 Average Daily Amount | | 3 Contract Amount | | 4 Pipe Size(s) | 5* R or E |
|-------------------------|-----------|---------------------------|-----------|----------------------|-----------------|-------------------|--------------|
| Water System | PWSID | MGD | # of Days | MGD | Expiration Date | Inches | |
| Johnston County | 03-51-070 | 3.90 | 365 | N/A | Perpetual | 12 | E |
| Dunn | 03-43-010 | 2.00 | 365 | 2.5 | Perpetual | 6 | E |
| Erwin | 03-43-035 | 0.75 | 365 | 1.0 | Perpetual | 6 | E |
| Fuquay Varina | 03-92-055 | 1.30 | 365 | 1.3 | 02-23-2029 | 12 | E |
| Holly Springs | 03-92-050 | 1.00 | 365 | 1.0 | 01-01-2041 | 12 | E |
| Smithfield | 03-51-010 | 1.00 | 365 | N/A | | 12 | E |
| Apex | 03-92-045 | 1.00 | 365 | N/A | | 12 | E |
| Raleigh | 03-92-010 | 2.00 | 365 | N/A | | 12 | E |
| Cary | 03-92-040 | 1.00 | 365 | N/A | | 12 | E |

*NOTE Column 5 R=Regular Use, E=Emergency Use

3-E. What is the Total Amount of Purchase Contracts available for Regular Use? 0.0 MGD (Do not include emergency use connections in total)

SYSTEM NAME Harnett County Public Utilities PWSID 03-43-045

3-J. WATER TREATMENT PLANTS List all WTPs, including any under construction, as of 12/31/2000. **Mark and label locations on the System Map.**

| Water Treatment Plant Name | Permitted Capacity MGD | Source(s) |
|--|------------------------|-----------------|
| Harnett County Regional Water Treatment Facility | 12.0 | Cape Fear River |
| | | |
| | | |
| | | |

3-K. What is the system's finished water storage capacity? 23.80 Million Gallons

SECTION 4: WASTEWATER INFORMATION

4-A. List Average Daily Wastewater Discharges by Month for 2000 in Million Gallons per Day (MGD)

| | Average Daily | | Average Daily Discharge | | Average Daily Discharge | | Average Daily Discharge |
|-----|---------------|-----|-------------------------|-----|-------------------------|-----|-------------------------|
| Jan | 0.500 | Apr | 0.566 | Jul | 0.411 | Oct | 0.533 |
| Feb | 0.639 | May | 0.431 | Aug | 0.522 | Nov | 0.457 |
| Mar | 0.540 | Jun | 0.396 | Sep | 0.583 | Dec | 0.477 |

4-B. List all Wastewater Discharge and/or Land Application Permits held by the system. **Mark and label points of discharge and land application sites on the System Map.**

| 1 NPDES or Land Application Permit Number | 2 Permitted Capacity Dec. 31,2000 MGD | 3 Design Capacity MGD | 4 Average Annual Daily Discharge MGD | 5 Name of Receiving Stream | 6 Sub-Basin | 7 Maximum Daily Discharge MGD |
|---|---|--------------------------------|---|-------------------------------|-----------------|---|
| NC0030091 | 0.500 | 0.500 | 0.499 | Cape Fear | Cape Fear (2-3) | 0.600 |
| NC0007684 | N/A | 0.080 | | Cape Fear | Cape Fear (2-3) | 0.600 |
| WQ0002994 | 0.300 | N/A | | Spray Irrigation | N/A | N/A |
| NC0031470 | 0.400 | 0.400 | 0.088 | Jumping Run Creek | Cape Fear (2-3) | 0.125 |
| | | | | | | |
| | | | | | | |

4-C. List all Wastewater Discharge Connections with other systems. Mark and label the locations of connections on the System Map.

| 1 Wastewater Discharger | | 2 Wastewater Receiver | | 3 Average Daily Amount Discharged or Received | | 4 Contract Maximum |
|----------------------------|-------|--------------------------|-----------|--|-----------|-----------------------|
| Name | PWSID | Name | PWSID | MGD | # of Days | MGD |
| Bunnlevel-Riverside W/S | N/A | Town of Erwin | NC0064521 | 0.050 | 365 | 0.100 |
| | | | | | | |
| | | | | | | |
| | | | | | | |

4-D. Number of sewer service connections: 3475

4-E. Number of water service connections with septic systems: 17000 (Number in Sub-basin 1 Number in Sub-basin 2 Number in Sub-basin 3)

4-F. Are there plans to build or expand wastewater treatment facilities in the next 10 years? No Yes Please explain. The County is looking at regionalization of the Town of Lillington WWTP in lieu of expansion. The County has purchased (Year 2000) and is operating a 0.400 surface discharge plant from Rolling Hills Water in Anderson Creek.

SECTION 5: WATER CONSERVATION and DEMAND MANAGEMENT ACTIVITIES

5-A. What is the estimated total miles of distribution system lines? 1875 miles

5-B. List the primary types and sizes of distribution lines:

| | Asbestos Cement (AC) | Cast Iron (CI) | Ductile Iron (DI) | Galvanized Iron (GI) | Polyvinyl Chloride(PVC) | Other |
|----------------------|----------------------|----------------|-------------------|----------------------|-------------------------|-------|
| Size Range | 6-16" | | 16-20" | | 2-16" | |
| Estimated % of lines | 1 | | 5 | | 94 | |

5-C. Were any lines replaced in 2000? No Yes linear feet

5-D. Were any new water mains added in 2000? No Yes 27100 linear feet

5-E. Does this system have a program to work or flush hydrants? No Yes How often? Daily

5-F. Does this system have a valve exercise program? No Yes How often? Annually

SYSTEM NAME Harnett County Public Utilities

PWSID 03-43-045

- 5-G. Does this system have a cross-connection control program? No Yes
- 5-H. Has water pressure been inadequate in any part of the system? No Yes Please explain. _____
-
- 5-I. Does this system have a leak detection program? No Yes What type of equipment or methods are used? _____
-
- 5-J. Has water use ever been restricted since 1992? No Yes Please explain. Irrigation was restricted. A rotation system was used to limit water use.
- 5-K. Does this system have a water conservation plan? No Yes Please attach a copy.
- 5-L. Did this system distribute water conservation information in 2000? No Yes
- 5-M. Are there any local requirements on plumbing fixture water use which are stricter than the NC State Building Code? No Yes Please explain.
-
- 5-N. Does this system have a program to encourage replacement or retrofit of older, higher water-use plumbing fixtures? No Yes
- 5-O. Does this system have a water shortage or drought response plan? No Yes Please attach a copy.
- 5-P. Is raw water metered? No Yes
- 5-Q. Is finished water output metered? No Yes
- 5-R. Do you have a meter replacement program? No Yes
- 5-S. How many meters were replaced in 2000? _____ meters
- 5-T. How old are the oldest meters in the system? 23 years
- 5-U. What type of rate structure is used? Decreasing Block Flat Rate Increasing Block Seasonally Adjusted Other Fixed
- Attach a detailed description of the rate structure to this document.
- 5-V. Are there meters for outdoor water use, such as irrigation, which are not billed for sewer services? No Yes # of meters 93
- 5-W. Does this system use reclaimed water or plan to use it within the next five years? No Yes # of connections _____ ; _____ MGD

SECTION 6: SYSTEM MAP

Review, correct, and return the enclosed system map Check Plot to show the present boundaries of the water distribution system service area, points of intake and discharge, wells, water and wastewater treatment facilities, and water and wastewater interconnections with other systems. Also, show any proposed points of intake or discharge, wells, water and wastewater facilities, water and wastewater interconnections, and future service area extensions. Use symbols shown on the attached map.

NC Division of Water Resources, Water Supply Planning Section, 1611 Mail Service Center, Raleigh NC 27699-1611, (919) 733-4064 Part 2 Page 9

SECTION 8: FUTURE WATER SUPPLY NEEDS

Local governments should maintain adequate water supplies to ensure that average daily water demands do not exceed 80% of the available supply. Completion of the following table will demonstrate whether existing supplies are adequate to satisfy this requirement and when additional water supply will be needed.

Table 8-A. AVERAGE DAILY DEMAND AS PERCENT OF SUPPLY Show all quantities in MGD.

| Available Supply, MGD | 2000 | 2005 | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |
|--|-------------|-------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| (1) Existing Surface Water Supply (Item 3-B) | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 |
| (2) Existing Ground Water Supply (Item 3-G) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| (3) Existing Purchase Contracts (Item 3-E) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| (4) Future Supplies (Item 7-E) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| (5) Total Available Supply [sum (1) thru (4)] | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 | 32.0 |
| Average Daily Demand, MGD | | | | | | | | | | | |
| (6) Service Area Demand (Item 7-B, Line 7) | 6.446 | 6.376 | 7.655 | 8.699 | 9.885 | 11.234 | 12.766 | 14.507 | 16.485 | 18.733 | 21.288 |

| Additional Information for Jordan Lake Allocation | | | | | | | | | | | |

| Available Supply, MGD | 2000 | 2005 | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |
|---|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|
| (12) Sales Under Existing Contracts | 0.72 | 1.03 | 1.33 | 1.79 | 2.22 | 3.05 | 3.87 | 4.85 | 6.29 | 7.02 | 7.74 |
| (13) Expected Sales Under Future Contracts | 0.20 | 0.350 | 1.43 | 2.04 | 2.65 | 2.95 | 3.25 | 3.50 | 3.75 | 4.25 | 4.75 |
| (14) Demand in each planning period [(6)+(12)+(13)] | 7.37 | 8.89 | 10.41 | 12.583 | 14.76 | 17.32 | 19.88 | 23.20 | 26.52 | 30.15 | 33.77 |
| (15) Supply minus Demand [(5) - (14)] | 24.63 | 23.11 | 21.59 | 19.42 | 17.24 | 14.68 | 12.12 | 8.80 | 5.48 | 1.85 | -1.77 |

8-B. Does Line 10 above indicate that demand will exceed 80% of available supply before the year 2030? No Yes
 If yes, your Jordan Lake Water Supply Storage Allocation Application should include the following items:

- (1) Alternatives for obtaining additional water supply to meet future demands. Use the following tables to summarize the various future water supply alternatives available to your system. Attach a detailed description of each water supply project shown in each alternative. The sooner the additional supply will be needed, the more specific your plans need to be.
- (2) A demand management program to ensure efficient use of your available water supply. A program should include: conducting water audits at least annually to closely monitor water use; targeting large water customers for increased efficiency; modifying water rate structures; identifying and reducing the amount of leaks and unaccounted-for water; and reusing reclaimed water for non-potable uses.
- (3) Restrictive measures to control demand if the additional supply is not available when demand exceeds 80% of available supply, such as placing a moratorium on additional water connections until the additional supply is available or amending or developing your water shortage response ordinance to trigger mandatory water conservation as water demand approaches the available supply.

Future Supply Alternative List the components of each alternative scenario including the planning period when each component will come online.

| (#1) | 2000 | 2005 | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |
|---|-------|-------|-------|-------|-------|-------|-------|------|------|------|-------|
| (1) Line (15) from Table 8-A "Existing Supply - Demand" | 24.63 | 23.11 | 21.59 | 19.42 | 17.24 | 14.68 | 12.12 | 8.80 | 5.48 | 1.85 | -1.77 |
| (2) Available supply from Project 1 (describe) | | | | | | | | | | | |
| Available supply from Project 2 (describe) | | | | | | | | | | | |
| Available supply from Project 3 - Dam on Deep river | | | | | | | | 18 | 18 | 18 | 18 |
| (3) Supply available for future needs [(1) + (2)] | | | | | | | | | | | |
| (4) Total discharge to Source Basin | | | | | | | | | | | |

| (#1) | 2000 | 2005 | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |
|---|------|------|------|------|------|------|------|------|------|------|------|
| (5) Consumptive Use in Source Basin | | | | | | | | | | | |
| (6) Total discharge to Receiving Basin | | | | | | | | | | | |
| (7) Consumptive Use in Receiving Basin | | | | | | | | | | | |
| (8) Amount not returned to Source Basin [(6) + (7)] | | | | | | | | | | | |

List details of the future supply options include in this alternative in the table below.

Attach additional pages as needed to summarize all alternatives.

8-C. Are peak day demands expected to exceed the water treatment plant capacity by 2010? No Yes
 If yes, what are your plans for increasing water treatment capacity?

The County is currently working with the State to upgrade the plant filtration rate to 6 gpm/ft2. This filtration rate will increase the plant production capacity to 18 mgd. The County is currently working on the next major upgrade which will occur in 4 to 5 years.

8-D. Does this system have an interconnection with another system capable of providing water in an emergency? No Yes If not, what are your plans for interconnecting (or please explain why an interconnection is not feasible or not necessary).

8-E. Has this system participated in regional water supply or water use planning? No Yes Please describe. The County has been active in developing a regional water system. We are currently installing the transmission lines to serve Southern Wake County. The system already serves Harnett County, but areas in five other counties. We currently have interconnections with Erwin, Dunn, Johnston County, Fuquay Varina. The County is also working on agreements with Smithfield and Raleigh.

SYSTEM NAME HARNETT COUNTY PUBLIC UTILITIES PWSID 03-43-045

F. List the major water supply reports or studies used for planning. Water Supply Plan 1992, 1995, 1996, 1997 and 1998.

SECTION 9: TECHNICAL ASSISTANCE NEEDS

Is technical assistance needed:

- 9-A. to develop a local water supply plan? No Yes
- 9-B. with a leak detection program? No Yes
- 9-C. with a demand management or water conservation program? No Yes
- 9-D. with a water shortage response plan? No Yes
- 9-E. to identify alternative or future water supply sources? No Yes
- 9-F. with a capacity development plan? No Yes
- 9-G. with a wellhead or source water protection plan? No Yes
- 9-H. with water system compliance or operational problems? No Yes
- 9-I. with Consumer Confidence Reports? No Yes

9-J. Please describe any other needs or issues regarding your water supply sources, any water system deficiencies or needed improvements (storage, treatment, etc.), or your ability to meet present and future water needs. Include both quantity and quality considerations, as well as financial, technical, managerial, permitting, and compliance issues.

**HARNETT COUNTY
WATER USE CALCULATIONS FOR YEAR 2000**

A. RESIDENTIAL USE

2000 POPULATION = 66,097

$$\frac{4.08 \text{ mgd}}{66097 \text{ population}} \times \frac{1,000,000}{1 \text{ mg}} = 62.0 \text{ gallons per day per person}$$

AVERAGE USE

| | <u>population</u> | <u>gpdpc</u> | <u>mgd</u> |
|------|-------------------|--------------|---|
| 2000 | 66,097 | 62.0 | 4.098 |
| 2005 | 75,112 | 62.0 | 4.657 |
| 2010 | 85,356 | 62.0 | 5.292 population |
| 2015 | 96,997 | 62.0 | 6.014 based on State Planning |

- 1 column (I) for Fuquay 1997 and 2000 reports negative transfer of water. This is due to water from the Neuse being transferred to the south side plant in Fuquay which discharges into Cape Fear (2-3).
- 2 Discharge records from the south side plant indicated more flow discharged into the Cape Fear basin then is being transferred to Fuquay. Reported no wastewater plant discharge into the Neuse for 1997-2000 in column (G).
- 3 column (F) for Fuquay year 2010,2020 reports south side plant treatment capacity.
- 4 column (C) years 2010 and 2020 for Fuquay and Holly Springs reports contracted amount of water usage.
- 5 Chatham County and Moore County water use is based on contract amount.
- 6 wastewater discharge from Chatham and Moore could be in the Lumber and Deep River basins.
- 7 consumptive loss for Chatham and Moore to the Deep or Lumber are assumed to be 20% of the loss to the Cape Fear.
- 8 Cape Fear consumptive loss is assumed to be 20 %.
- 9 Fuquay wastewater discharge is based of current plant treatment capacity
